

way to uncover truth compared to a blanket "Why isn't this working?"

It's also important to understand that not every team member prefers to discuss these topics using the same medium. While some may prefer video communication, others may prefer voice, writing, or something else. Remote leaders should strive to be inclusive when searching for answers and solutions.

Sentiment tracking and feedback

Particularly in remote companies, leadership should consider implementing processes around internal feedback. Companies will often wait to gather internal feedback until an exit interview after someone's resigned, or they'll organize an occasional survey to take a pulse on the company's engagement. GitLab prefers shorter, but more frequent, check-ins, aligned to our values of collaboration and iteration.

Ask questions that shed light on whether or not a team member is thriving or struggling, and pay close attention to any adjustable workplace factors that are contributing either positively or negatively.

Learn more about GitLab's approach and guidance on feedback.

What are some tips for staying productive when working remotely?

Create mental space

One of the more challenging aspects of remote work is closing your mental "tabs" once you disconnect from work. Since remote enables you to work a non-linear workday, it's difficult to rationalize where one working session ends and another begins.

Clear unread messages daily/weekly

You can reduce your mental load by clearing all your unread messages at the end of each working day or week (seriously!). Slack refers to this as Mark all messages as read, which is easily toggled by simultaneously pressing Shift + Esc.

Communicate your work preferences

Create a rudimentary README that clarifies how you work. Ideally, it's working from a GitLab Issue board, tagging system, or To-Do list which can be understood and used company-wide. You can then post the link to your README in your Slack profile, pointing others to it. Showing others how to deliberately choose asynchronous over synchronous is vital to reinforcing our operating principle of Bias towards asynchronous communication.

Be transparent on capacity

In a remote setting, it's important to let others know you need uninterrupted focus. You should feel safe to manually adjust your status to indicate when you are at capacity or engaged in focus time. This models healthy boundaries while communicating that Slack and synchronous conversation should not be the default.

What are some tips for managing time when working remotely?

Time tracking

Be aware of how much time you spend working versus distractions. You can use time tracking tools to get a baseline, then set goals for increasing productivity as you learn to reduce distractions.

This Forbes article on remote-work time management tips also recommends

- 1. Finding your own space
- 1. Managing your energy
- 1. Taking strategic breaks
- 1. Collaborating with your partner
- 1. Setting healthy boundaries

What are some tips for avoiding distractions when working remotely?

GitLab employee Matej L. outlines 9 tips for eliminating remote work distractions and being more productive here.

Pro tip: experiment with removing Slack from your phone. A litany of studies have covered the addictive nature of smartphones. Even if you aren't sure if this approach will benefit you, give it a try. It's what we call a two-way door.

What are some resources for remote workers struggling with their mental health?

Mental Health Tool Stack

The following tools and strategies are used by the GitLab team to manage burnout and make mental health a priority.

Tool	Use
Headspace	Meditation app
Non-Linear Workdays	All-remote work strategy to increase life harmony
README Files	Space to share bio, remote work setup, and information about working style. Check out the GitLab's Engineering Team README files as an example.
Slack	Non-work conversation in channels like mindfulness and mental-health-aware
The donut bot	Random coffee chat meeting match bot
Modern Health Community Circles	Public community conversations hosted by Modern Health
Coffee Chats	Social calls with team members
Walk and Talk meeting structure	An optional structure for both work and social calls
Burnout Index	Burnout assessment tool
Burnout assessment	Burnout assessment tool
Daylio	Mood tracker app

Contribute your lessons

Creating a healthy remote workplace is essential to business success. If you or your company has an experience that would benefit the greater world, consider creating a merge request and adding a contribution to this page.

Return to the main all-remote page.

SECTION: company/culture/all-remote/non-linear-workday.md

On this page, we're detailing what life can look and feel like when embracing a non-linear workday, paired with suggestions on catalyzing your imagination to consider possibilities that simply are not possible in a colocated, synchronous workplace.

Q: What is a non-linear workday routine?

A non-linear workday means that you can move between work and non-work time on an asynchronous schedule - without needing to account for PTO (paid-time-off). For example, a remote worker may start their day at 6:00 am and work till 9:00 am local time. To spend time with family, this person will not check work email or resume working again until 3:00 pm local time and continues to work until 8:00 pm local time. And tomorrow may be a totally different schedule depending on work/life circumstances.

Breaking preconceived notions about routine

{{< youtube "ZlUpDkoqv0" >}}

In the GitLab Unfiltered video above, Darren M. (GitLab's Head of Remote) and Elisa R. (Founder of The Cowork Experience) discuss the impact and purpose of routines when looking at satisfaction and productivity.

A common recommendation for those new to remote work is to find a routine early on, and stick to it. While this may be sound advice for some, it ignores the reality that remote enables a complete deconstruction of the perceived need for routine.

Routine is a common suggestion not necessarily because it is good, but because it is tradition. Routine is mandated in a colocated environment, where team members are required to commute and work between fixed hours. We have been conditioned to believe that routine keeps us disciplined, when in reality, routine simply makes it easier for colocated companies to keep workers in line.

Many people adhere to routines simply because they know no other way. Remote allows another option, thanks to the tremendous benefits of asynchronous workflows, handbook-first documentation, and company wide transparency.

What is a non-linear workday?

{{< youtube "SeTTehyZsFc" >}}

In the video above, GitLab's Head of Remote talks with Megan Dilley (Director, Remote Work Association) about remote work's democratizing power, the importance of community, and projections for what life will look like after the great remote work migration of 2020. Discover more in GitLab's Remote Work playlist.

Perhaps the most useful approach to describing a non-linear workday is to share an example. In transparency, this is an actual example from a GitLab team member.

- Darren wakes up at 6:00 AM on a Tuesday in Montana. After a shockingly brief 30 second commute from one room to another, he's ready to start his workday, coffee in hand.

- Darren begins work at 6:30 AM, and works until 8:30 AM. He changes his Slack status to a skier emoji, noting to colleagues that he'll be out through 4:30 PM local time. (This distinction is important, as his company works asynchronously with colleagues across an ever-changing array of time zones. Said another way, time is relative.)

- He then cooks breakfast, eats with his family, and packs his ski gear into the car. By 10:00 AM, the family is skiing. There is almost no one on the mountain, as the vast majority of the world is following a typical routine that pulls them into a colocated office by 10:00 AM on any given Tuesday. Lift lines are nonexistent. Lift tickets were heavily discounted · it's Tuesday, after all · and there was no traffic to contend with. All of these are spoils of an off-peak life.

- By 3:00 PM, Darren and his family ski back to the car, refreshed after an exhilarating day. Given that they're departing the mountain before rush hour has any impact on traffic, they're back to their rental apartment by 3:30 PM.

- After a shower and an early dinner, Darren logs back on to work at 4:30 PM, enthused to tackle ongoing projects and help move issues forward. But first, he shares a few photos he grabbed while skiing · something that is encouraged when you operate in a non-judgemental culture and measure people on impact, not activity. Though working remotely with hundreds of colleagues across six continents, this deliberate approach to informal communication creates

personal bonds that are, in many ways, deeper than those formed in-office.

- Because it's winter in Montana, it's fairly dark outside by 5:00 PM. Darren has maximized his daylight hours, and has time-shifted his working day to primarily occur during darkness. Given that he would likely be indoors during this time anyway, it's more conducive to work. There is no pull to leave and explore the outdoors when it is dark. Instead, it is an ideal time to work, despite the fact that resuming your work day while most others are ending theirs is incongruent with the conventional definition of routine.

{style="max-width: 50%;"}

We should pause at this point and recognize that time is still relative. When Darren resumes his workday at 4:30 PM, he has six more hours to contribute if working a standard eight-hour day. It is important to not get caught up in local times. 4:30 PM may sound like an absurd time to resume working, but that's morning, afternoon, and night for various other members on his team.

- Darren resumes his work from 4:30 PM to 10:30 PM, relying on low-context documentation created by his colleagues while he was skiing to understand the current state of work that he is involved in. He contributes asynchronously, as to minimize required meetings and be considerate of colleagues who may also be working in non-linear fashion.

Examples of a non-linear workday

You can experience non-linear workdays on a spectrum. While the above example is purposefully extreme to articulate benefits, there are practical, everyday ways to break up your day. This enables you to refresh in a way that is uniquely beneficial to you, and can adapt based on the demands of your day.

- Parents and caregivers may take time during their morning and afternoon to take children to school and spend time bonding during a commute that they'd be forced to outsource if working a more rigid schedule.
- A runner who schedules training sessions around meetings.
- Scheduling fitness as a midday break, which is ideal for those who are not keen on exercising first thing in the morning or after their workday.
- Scheduling meeting blocks based on the evolving nap schedule of a toddler.
- Segmenting your day to create availability to volunteer during certain daylight hours at a food bank, library, community center, etc.
- Structuring your day to handle everyday tasks (e.g. an oil change for your vehicle, meeting with a contractor repairing your home, etc.). A bonus could be tending to these tasks during non-peak hours, which creates efficiency by avoiding transit during rush hours.

Q: What are the benefits of a non-linear workday routine?

Flexibility

A non-linear workday empowers team members to live and work both when and where they're most productive.

Autonomy

Team members are given agency to move projects forward on a schedule that suits them. Because GitLab measures impact, not activity, people are free to achieve results when it best suits them.

Efficiency

Remote decouples routine from responsibility. Employees who enjoy being a manager of one thrive in a remote setting, and often exhibit more discipline to work well when no one is looking.

Q: What are the challenges of a non-linear workday routine?

Juggling time zones

Depending on where you and your teammates are primarily based, it may be a struggle to communicate well with others in a different time zone.

Staying organized

One challenging aspect of remote work is delineating where one working session ends and another begins. There is often no reason or excuse to stop or shift tasks other than "the clock tells me it's time to stop."

Distractions

For novice remote workers, it's important to think about when and where you prefer to work on a daily basis. Optimize your physical and mental space for focus and design a space that prevents distractions as a boon for your remote work.

Q: What are some common distractions when working remotely?

The most common distractions to remote workers are ambient sounds, visual distractions, and working in areas with high traffic. Attempt to dedicate both physical and mental space where only work occurs. This enables you to focus specifically on work and be sure to healthily disconnect when you exit the space.

Q: What are the best ways to stay productive when working remotely?

It can be tempting to default to old ways, whereas working a non-linear schedule or from a unique location requires doing things differently. Basecamp's Handbook tells us that there's as much to unlearn as there is to learn when it comes to thriving in a remote role.

While remote work provides flexibility, freedom, and autonomy, it also requires adaptability and experimentation when it comes to learning remote communication. A few pro tips include:

- Learn and adapt to the communication preferences of your co-workers
- Bolster your internet connection, and have a back up plan
- Monitor your mental health and emotional health
- Be intentional about informal communication to foster co-working relationships

There is more benefit to working remotely than simply getting rid of the commute! To celebrate, we've curated an extensive list of resources for remote professionals, teams, and organizations.

GitLab's library of guides to working remotely is another great resource.

Q: What are some tips for staying organized when working remotely?

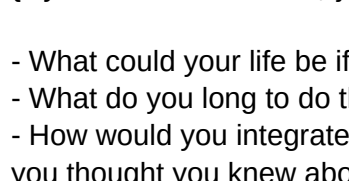

You can explore our complete guide for remote workers, which contains great tips for staying organized such as:

- Invest time learning the company's technology & tools to maximize efficiency
- Develop a schedule that you can test and tweak
- Create strategic connections with co-workers
- Set up work-life boundaries

The non-linear workday decouples time from work and acts as a forcing function to embrace asynchronous workflows. Local times are only as important as your company relies on synchronicity to get things done.

The more this bothers you, the further you need to distance your organization from synchronous defaults.

Fostering your imagination

{style="max-width: 50%;"}

- What could your life be if no two days were ever the same?
- What do you long to do that you think a work routine is holding you back from?
- How would you integrate work into your life if you were given permission to scrap everything you thought you knew about the importance of routines?

Answering the above will allow you to truly evaluate what elements of routine are beneficial to you, and which are holding you back.

The above skiing example is a maximally efficient day. It was a full working day, and a full day of exploring and spending meaningful time with family. The above team member could've opted to take PTO (paid time off), or opted for a shorter ski session. He could've taken a half-day, thereby extending the ski session or simply providing more buffer time between work and play.

You could swap anything in for skiing and envision how it could apply to you. From participating in midday school activities with your children, to helping with a midday community service event, to being available to serve as support during an important medical appointment for a loved one · the examples are endless.

The point is, a non-linear mindset gives you options to break free from routine and structure each day differently.

{{< youtube "csS3iTjIHNo?start=1193" >}}

In a GitLab Unfiltered conversation, Dani from Ceridian asked GitLab's Head of Remote the following question: "What's a question that people don't ask, but you feel they should, about remote work?"

His answer is verbalized in the video above, and partially transcribed below.

> What could life look like if I never had to commute again? If I did not have to be in this particular city for work?

>

> What you're seeing en masse (due to COVID-19) is people being thrust into remote, and they're trying to replicate virtually the in-office experience.

>

> I want people to give themselves permission to realize that remote is an entirely new universe. You don't have the commute. You don't have the stigma and office expectations. You can potentially shift your day to work during your peak productivity hours, which opens up hours that have never been accessible to you before.

>

> It's the ultimate blank slate, the ultimate life cheat code. There tends to be remoter's guilt, where you feel like you need to over-produce as a remote employee to compensate for the removal of a commute. The commute was never the employer's to begin with; that was always your time.

>

> You can do something with that. You can be innovative with it. · Darren M., Head of Remote, GitLab

What is required to enable non-linear workdays?

{style="max-width: 50%;"}

The example detailed here would not have been possible without a few realities already in place.

- The company must work handbook-first, such that all meaningful takeaways from conversations are documented in their proper place, around the clock.
- The company must embrace asynchronous workflows (including tools like GitLab as well as processes) in a deliberate, intentional, and thorough way.
- The company must support a non-judgemental culture, which measures team members on impact rather than activity. This enables people to enter and exit work as they so choose, with no fear of retribution for doing something as unorthodox as skiing while everyone else works, and working while everyone else wishes they would've gone skiing.
- A personal dedication to being a manager of one, able to focus on the right tasks while working from a foreign environment.
- An understanding that not every single day will look like this. Even masters of non-linear workdays recognize that some days are less amenable to midday excursions than others. Rather than being sour about that, embrace the thrill of it being possible at all, and put effort into structuring your upcoming schedule in a way that allows for such days. As a manager of one, you have to take control over (and be accountable for) your schedule. Otherwise, other forces of the world and work will control it for you.

In December of 2021, the Learning and Development team hosted Dr. Krystal Wilkinson, senior lecturer at Manchester Metropolitan University, to speak about her research on the impact, challenges, and realities of working structures similar to the non-linear workday. Watch the recording on the GitLab Unfiltered YouTube channel.

What about meetings?

The obvious question when discussing such examples is this: "How do you leave work during a time when meetings are most likely to be scheduled?"

The not-so-obvious answer is: Create a workplace culture where meetings are a last resort, and ensure that unavoidable meetings can be contributed to asynchronously.

It bears repeating that not every single day will present itself as a natural, meeting-free day. However, the more intentional your company is about ruthlessly minimizing meetings, separating decision gathering from decision making, and insisting that all work begin where it eventually needs to end up (e.g. in a GitLab issue or merge request, the more feasible it will be. You'll also realize benefits on the mental health front.

GitLab's approach to meetings, as with all of our processes, is public in our handbook. We encourage leaders to study, implement, and make suggestions for improvement.

Find what works for you

While embracing non-linear workdays can be incredibly freeing, it's also important to recognize that breaking daily routines might not be productive for everyone. In a conversation in GitLab's neurodiversity Slack channel, team members shared a range of experiences with non-linear workdays.

Ultimately, it's up to each person to experiment and determine their optimal work preferences and schedule (or lack thereof). Whether your schedule looks different each day, or you stick to a strict routine, or you incorporate elements of both, the key is knowing that you have the freedom and autonomy to decide what's best for you.

Set clear priorities: 3 tasks

Non-linear workdays are focused on results. Building systems to focus on results helps avoid overwhelm and burnout. The video below reviews the 3 Tasks System as a method for setting and achieving key priorities.

{{< youtube "H5Sg3Gw8E0Y" >}}

3 Tasks System Summary

- The goal is to achieve 3 meaningful outcomes every day, week, month, and year. Small outcomes add up to meaningful and long-term results
- Productivity is about doing the right things at the right time. Choosing 3 tasks forces prioritization and helps avoid context switching
- Key benefits of this system include:
 1. reduction in time spent on unimportant work

1. improved personal efficiency and effectiveness
 1. increased sense of accomplishment
 1. increased results over time
- Choose a recording system that works for you: notepad, sticky notes, Mac reminders, GitLab issues, etc.
 - Each day, choose what needs to get done today and decide what can be punted to future days/months
 - Other things will come up outside of your 3 tasks. When they do, write them down on a next or future card. Write them down so you can take remove the pressure of having to remember these tasks.
 - Adapt this system to meet your own needs

Contribute your lessons

GitLab believes that all-remote is the future of work, and remote companies have a shared responsibility to show the way for other organizations who are embracing it. If you or your company has an experience that would benefit the greater world, consider creating a merge request and adding a contribution to this page.

Return to the main all-remote page.

SECTION: company/culture/all-remote/onboarding.md

{style="max-width: 50%;"}

On this page, we're detailing how to successfully onboard new hires in a remote environment.

What is remote onboarding?

Onboarding is the official process of integrating new team members into an organization. Remote onboarding is done via technology without any face-to-face interactions.

How long should remote onboarding take?

GitLab believes the onboarding process is incredibly important. We don't expect anyone to hit the ground running from day one.

We anticipate the remote onboarding process to take at least two full weeks, with the third

week designated for team-specific onboarding and training. We encourage new team members to participate in their teams' work in the first two weeks, but without pressure to contribute heavily.

What is an onboarding session?

At GitLab, we like to do what we call "dogfooding" our own product. Hence onboarding tasks are completed in a GitLab issue.

All onboarding steps are found in an onboarding issue template, which contains a standardized set of tasks and steps that each new team member will complete. The onboarding process for the new team member is self-driven and self-learning and as asynchronous as possible. This is intentional, in order to aid acclimation into the remote life at GitLab.

Read more about GitLab's all-remote onboarding process in our handbook.

How to manage onboarding new hires remotely

Onboarding remotely should focus on three key dimensions: the organizational, the technical, and the social. By using this integrated approach, top companies enable their team members to stay and thrive in their roles. We'll show how you can focus on these three key dimensions of onboarding through an all-remote onboarding process.

How to prepare for remote onboarding

One way to begin creating social connections for new remote team members is to have them added to a chat channel. GitLab's newteammembers Slack channel is a place for people to introduce themselves with photos and information about themselves and their interests.

Organizational onboarding

A large part of onboarding is providing answers to logistical questions:

1. How do I sign up for benefits?
1. What tools should I use?
1. Where do I go to find answers?
1. Who can help me with ?

Traditional in-person companies usually rely on trainers or more hands-on approaches to help new hires navigate their surroundings. All-remote companies have to be more efficient and make information easily accessible, so documentation will be essential for a smooth onboarding process. At GitLab, we provide a detailed handbook that is always evolving.

The GitLab team handbook is the central repository for how we run the company. It consists of over 2,000 web pages of text, all searchable of course. Our handbook serves as a single source of truth that all team members can reference and depend on for answers about GitLab.

For onboarding, we're able to direct new hires to a huge repository of information and also teaching them to be self-sufficient and proactive when looking for answers. Because we've implemented a handbook-first approach, the GitLab handbook is always changing and growing as we

learn new things.

In an all-remote setting where team members are possibly working from a variety of timezones, mastering asynchronous workflows is vital to avoiding dysfunction. Onboarding through documentation is more efficient because it's scalable, repeatable, and instills the basics of asynchronous work.

Additional resources:

- 1. GitLab onboarding
- 1. Guide for starting a remote job
- 1. Adopting a self-service and self-learning mentality

Technical requirements for all-remote onboarding

While tools are an important part of any role, new hires need to feel empowered to use them. Organizations can help build technical confidence by setting up early wins with action items the new hire can complete as they move through their training. Organizational onboarding provides the access to information through handbooks/documentation, and technical onboarding is about using that knowledge to work through the tools.

At GitLab, we practice dogfooding. Our entire company uses GitLab to collaborate on the handbook and we also create issues and merge requests in our product. For all new GitLab hires, we have created an onboarding issue template that has tasks to complete each day. We believe in using the tools we create. This allows new hires to become familiar with GitLab in a way that feels meaningful (e.g. in learning GitLab, they are also accomplishing necessary onboarding tasks). This also provides a continual set of new users to test GitLab with fresh eyes. These individuals are ideally positioned to point out missing features or areas for improvement as we iterate on the product.

For technical onboarding, give new hires access to the tools they'll be using in their roles and, most importantly, encourage them to use the tools as early as possible. Using tools, even for very small tasks, builds confidence and helps new employees to feel productive and empowered.

Common remote onboarding challenges

One of the biggest challenges that new team members may encounter when onboarding remotely is not knowing who to ask for help with technical issues or "newbie questions." Assigning an onboarding buddy is an essential step so that team members always have a friendly face they can talk to.

Onboarding remotely can also bring technical issues: everything from delayed equipment delivery, to trouble with account creation, to the need to rapidly acquire new technical skills. It's very important to ensure that your IT team has adequate resources to be able to support new team members during their first days and weeks on the job.

Crucially, when there are issues with onboarding, new team members may not feel comfortable raising them. Close the loop by asking for regular feedback on the onboarding experience, and be sure to act on that feedback.

Additional resources:

- 1. All-remote management
- 1. Tools that enable remote teams
- 1. 3 things I learned in my first month at GitLab

Social requirements for all-remote onboarding

Starting a new job can be overwhelming. If a new hire is used to working in a traditional office, adjusting to the remote work lifestyle might be a challenge. Having socialization as part of the onboarding process can help team members feel more connected to their new teams, even though they don't share an office.

In an all-remote company, it's important to encourage informal communication so that team members can build relationships. This can be incorporated into the onboarding process in a couple of key ways:

1. Assign an onboarding buddy. This individual can be a friendly point of contact for a new team member and also introduce them to others. Onboarding buddies often set the expectation for how to build relationships with other team members, so new hires and onboarding buddies should communicate in a variety of ways, such as video calls, check-ins on Slack, and coffee chats. At GitLab, we take this kind of role seriously and have an entire handbook page dedicated to onboarding buddies.

1. Formally design informal communication. In an all-remote environment, informal communication should be formally addressed. Leaders should organize informal communication and provide structured opportunities for new hires to get to know their coworkers. We incorporate socializing tasks into our onboarding template such as scheduling coffee chats, introducing yourself in the new team members slack channel, or participating in a video call.

1. Creating personal connections. We are social creatures, and research shows the value of personal connections. While there are tremendous advantages to operating a 100% remote company, be open to participating with in-person elements, even if they're optional.

Additional resources:

- 1. Building and reinforcing a sustainable culture
- 1. Considerations for in-person interactions in a remote company
- 1. Social slack channel ideas

The importance of the onboarding process

{style="max-width: 50%;"}

Onboarding is the official process of integrating new team members into an organization. The difference between onboarding and orientation is that orientation is typically a singular event, whereas onboarding is a continuous process during a team member's first year. Having an efficient onboarding process can have long-term benefits:

1. Better team member retention
1. More productive, more quickly
1. Reduces anxiety
1. Sets expectations

Onboarding is an investment in the long term success of new hires and in the company as well. Studies show that 87% of team members are less likely to leave a company when they feel engaged. Companies that invest in onboarding report 54% more productivity from new hires.

When hiring in an all-remote organization, a cohesive onboarding process is especially important because not only do you have to give new hires the information they need to do their jobs, you have to empower them to think remotely as well. Remote onboarding relies heavily on documentation, anticipating the needs of new team members, and a dedication to continuously improving the process based on feedback.

Remote onboarding best practices

- Outline work logistics and expectations.

At GitLab, we believe the best way to operate is by documenting processes, guides, solutions, how-tos, and policies. Be sure to empower remote workers to adopt remote-first communication and workflow practices.

- Identify employee concerns and answer questions.

GitLab is committed to transparency. This value gives team members access to a great deal of visibility to what is going on throughout the organization. However, it does not negate the need to invite employees to ask questions.

- Add some excitement.

In addition to the incredible benefits of all-remote work, getting to network and interact with their team, whether remote or in-person is part of what makes work fun and exciting - especially in an all-remote culture.

Here's our list of more than 20 ways to participate in a happy, healthy informal work culture.

- Schedule check-ins with new employees.

It's a good idea to schedule weekly 1-1 meetings to field questions, ask about any challenges, or focus on areas to grow and build trust. Managers can supplement formal meetings with coffee chats where no work is discussed: the goal is to simply listen, share, and have open conversations and nurture the social component of remote working.

What are onboarding activities?

At GitLab, the first thirty days consist of a series of tasks to be completed sequentially. A sample GitLab onboarding sequence might look like:

- Day 1: Getting Started: Accounts and Paperwork
- Day 2: Remote Working and our Values
- Day 3: Security & Compliance
- Day 4: Social & Benefits
- Day 5: Git

- Weeks 2 - 4: Explore
- Week 3: Job Specific Tasks

What do new hires want from an onboarding program?

Onboarding is the first impression a new hire gets of your organization. It's critical to invest the time to do it well so that your new team members get to know you, understand what is expected of them, introduces them to co-workers and teammates, and sets them up to succeed.

At GitLab, we document to create a single source of truth so we can operate handbook-first and value transparency by making the handbook publicly accessible to all.

Remote onboarding tips

How is onboarding a remote employee different from an office employee?

Because remote onboarding is mostly self-guided, the real-time face-to-face ability for new employees to ask questions does not exist. Knowing this, we've created some important reminders for onboarding remote employees such as:

1. Check in immediately. Receiving and retaining a wealth of new information can be overwhelming, particularly on the first day of work.
1. Suggest helpful hints. Chances are that you've discovered some tips, tricks, and hacks-- share them proactively!
1. Remind them to introduce themselves. Remind the new team member to introduce themselves in the Slack channel newteammembers or relevant team channel. Encourage them to share some personal info and include a photo or two!
1. Encourage them to socialize with other new hires. For example, new employees might organize a group call with other new hires in order to walk through onboarding together, while learning about new personalities and departments of the company.
1. Introduce them to any tools for connecting with colleagues. Chat tools such as Slack may seem ubiquitous, but not everyone has used them before - and even if they have, they may not know how your network is organized.
1. Ask where they need help and connect them with the experts. Connect new team members with subject matter experts if your assigned team member requests additional help in a given area.
1. Keep checking in regularly. Checking in regularly will help them feel welcome and supported.
1. Provide backup if needed. If you plan to be out (e.g. vacation, company business, events, etc.) during a new team member's first few weeks, make sure that a backup person is available to offer support.

What are some tips to plan an effective employee onboarding training?

Best practices for effective onboarding include clear communication. A few ways to do this are:

- Encourage people to write everything down
- Allow open access to view all important documents
- Use screenshots so everyone at any time can follow the thought process
- Encourage non-work related communication for relationship building
- Encourage group video calls for bonding
- Encourage one-on-one video calls between people (as part of onboarding)

Remote first company culture

For many, building a remote first culture is challenging, but worthwhile. Culture is the barometer of how well an organization is communicating and reinforcing its values.

Culture is created when a company's values are prescriptively articulated and visibly reinforced through elements such as discretionary bonuses and linking promotions to values.

For new team members, this is even more crucial: if your culture is not self-reinforcing in a remote environment, it may not translate during the onboarding period.

Remote first company values

GitLab's six core values are

- Collaboration,
- Results,
- Efficiency,
- Diversity, Inclusion & Belonging,
- Iteration, and
- Transparency,

and together they spell the CREDIT we give each other by assuming good intent.

Feel free to adopt or remix our values for your remote-first team.

How to evaluate your existing onboarding process

In the spirit of transparency, GitLab's People Connect Team will evaluate the onboarding process by having new employees fill out an Onboarding Survey.

High-touch and low-touch flexibility

The beauty of an all-remote setting is that onboarding can be as high-touch or low-touch as a new hire wishes. Those who prefer visual learning can engage in a series of video calls and screen share sessions to walk through each element of their onboarding issue. Those who prefer more self-learning can benefit from thorough documentation and readily-available resources for self-guided learning.

That flexibility is unique to the all-remote environment, as those who prefer a self-guided experience are typically forced into a very social onboarding at colocated companies.

Empowerment from day one

{style="max-width: 50%;"}

The onboarding process should be empowering. At GitLab, if a new hire gets stuck during onboarding, they are encouraged to update the handbook, record a video to help others who may encounter the same obstacle, and contribute to learning and development from day one.

Learn more about our approach to All-Remote Learning and Development.

Project background

About GitLab and remote work

As a fully remote company and a leader in all-remote work, GitLab hopes to inspire other companies to embrace the future of work by publicly sharing its challenges and solutions to creating a thriving remote culture. To learn more, check out GitLab's Remote Manifesto and browse its extensive library of remote work resources.

Methodology

This is a qualitative study. GitLab interviewed over 200 professionals from throughout the world over the course of three months. Surveys were conducted via phone, video conference, or written questionnaire. Names and ages of respondents were not recorded unless they provided video footage. Results were tabulated and analyzed without knowledge of respondents' identities.

The interview questions were almost entirely open-ended, to avoid injecting bias. We reviewed and coded each response individually, and created this report to reflect respondents' statements. This brought us some surprising new insights, which we might not have found with a quantitative survey.

> "Since everyone is working remotely, there is a sense of equality, and an increased sense of empathy/compassion to teammates since everyone has challenges."

>

> - Digital sales representative, working remotely for one year

Key Takeaways

COVID-19 created a new wave of remote workers

56% of respondents started working remotely during the pandemic. However, when asked what they would change about the place they work, only 1% indicated they would like to go back to the office. The extended nature of COVID-19 ensures that these employees now identify as a remote worker. Identification is important, as it creates additional motivation to improve fluency and embrace workflows which strengthen distributed teams. Remote work was already a mainstay amongst freelancers, creatives, and entrepreneurs. COVID-19 has democratized the notion of decoupling geography from results, thrusting it into the corporate mainstream.

Remote isn't the future of work; it's the future of living

37% of respondents have optimized their lives to spend more time with their family or community. 30% are prioritizing the outdoors or exercise and health. And 26% are streamlining their schedules to reclaim more time in their days.

This sheds light on a nuanced reality: remote work is more about the future of living than work. Workers appreciate the flexibility to fit work into their life schedule as opposed to vice-versa, with many not needing to move in order to appreciate that optionality. The key is that remote work makes the day-to-day more manageable, with a series of minor quality of life adjustments amounting to a significant net improvement.

Remote leadership requires more pragmatism, fewer politics

A diverse array of responses show that remote workers expect flexibility, solid communication, and trust that they'll be responsible for achieving their objectives. With in-person politics playing less of a role in praise and promotion, clock-in and clock-out times are less relevant. Rather, workers will demand that they be judged solely on their outputs, which will help leadership remove bias from the evaluation process.

> "Think about the things outside of work that matter to you. You work to live, not the other way around."

>

> - Merchandise planner, eCommerce, working remotely 6 months

Work/life boundaries are a complicated challenge

When asked what advice they would offer to anyone selecting a remote work location, a stunning

77% of responses centered around four key areas: setting boundaries (25%) , staying focused and productive (20%) , protecting your mental and physical health (23%) , and putting personal priorities first (9%).

Given what we're learning about the accelerating rate of burnout across industries and with a growing center in remote workers, this could indicate that one of the biggest challenges we still face is to create healthy boundaries. Indeed, 22% of respondents stated that they have no dedicated home office space.

Supporting remote work is a boon for retention

In a world of variables, our data show an overwhelming link between company loyalty and support for remote work. 74% of respondents say they are "somewhat" to "very" likely to remain with their current employer "due to support of remote work."

SECTION: company/culture/all-remote/parenting.md

Parents who work from home have unique demands and expectations, as well as unique challenges. Being an excellent coworker and an excellent parent is a tall order, particularly when childcare and school are impacted by a global crisis.

{style="max-width: 50%;"}

While success may look different to each individual, it requires support from one's organization, company-wide alignment on values that enable parents to feel empowered, and a transparent atmosphere where advice may be shared.

Q: What are some work-from-home parenting jobs?

At GitLab, we believe that most jobs can be done remotely. We are the world's largest all-remote company with no company-owned offices anywhere on the planet. We have team members in more than 65 countries, many of whom are parents. It can be done; it should be done!

When looking for a parent-friendly job, instead of focusing on the specific role, look at the company. Do they offer flexible scheduling? No-ask PTO? Are they family first? Choose an organization that proactively supports parents and prioritizing your kids above your job.

Q: What are the benefits of work from home parenting?

While there are numerous advantages to remote work, being able to pair working and parenting/caregiving is considered an enormous benefit to many people.

1. You have more flexibility in your daily life (for kids, parents, friends, groceries, sports, deliveries).

1. No more time, stress, or money wasted on a commute (subway and bus fees, gas, car maintenance, tolls, etc.).

1. You can optimize your life for superior air quality and medical facilities, a healthier

community environment, and better schools for your children, rather than access to onsite jobs.

1. Expectant parents have the autonomy to more easily plan around and attend doctor's appointments, optimize for their physical comfort during the day, and work non-linear workdays to build in rest when needed.

1. Ability to travel to other places without taking vacation (family, fun, etc.).

1. Freedom to relocate, be location independent, or even travel with other remote professionals.

1. You can set up and decorate your office or workspace in whatever way works best for you.

1. You can choose your working hours based on when you're most productive.

Q: What are the challenges of work from home parenting?

A recent Forbes article on the challenges working parents faced during the pandemic listed the top issues as:

- burnout
- mental health
- work vs family life balance/boundaries
- video-meeting fatigue

At GitLab, we prioritize healthy work-life balance in each of these areas:

- combating isolation and burnout
- focus on mental health
- create healthy work/life balance
- more working, less meeting

Q: How do I manage my work remotely with kids?

While there is no one-size-fits-all answer, we have amassed some great tips for organizing a healthy work and life-with-kids balance.

Create a dedicated work area

For parents with toddlers who may not understand why a parent is home but unable to play or engage, consider working in a space with a door that you can shut. This creates a more obvious separation between work and life.

If you live in a space where such a division is impractical or impossible, consider working in a coworking space, external office, or shared community home through firms such as Codi. GitLab recognizes that not every living space is amenable to remote work, which is why we will reimburse for external spaces.

Block out family time on your calendar

{style="max-width: 50%;"}

If a work meeting can be scheduled, so can anything else. That could be lunch, time for fitness/meditation, or engaging with your kids. Be deliberate and intentional about putting

family functions on your calendar. That could be time for breakfast, driving to/from school, time for homework, or other activities.

Establish ground rules

{style="max-width: 50%;"}

Rules will look different for each family, and they will likely require iteration as projects change and children age. Setting rules of when and how a child (or children) may engage with a working parent is vital. While this may feel rigid or harsh, ambiguity in this area will likely lead to disappointment on both sides. These rules are empowering to the worker, as they're able to share with their manager and teams and weave this into their day-to-day work.

Waiting for work to neatly carve out time for a parent to engage with their child or children is an unwise approach. Be intentional about these ground rules and work with your manager to ensure that they are communicated up/out and respected by your team.

Working/parenting shifts via synced schedules

For working parents who have another working family member in the home, consider syncing your schedules so that kids are aware. This helps balance the load, and provides clarity to children. This works best when "parenting shifts" are scheduled into each other's work calendars and communicated with respective work teams.

Invite kids to meetings/work

If appropriate, consider inviting your child or children into meetings, or let them work/study in a shared space while you're at work. Remember that meetings are about the work, not the background, and kids barging into a meeting is indeed the best distraction in the world.

Q: What are some tips for balancing parenting and work as a remote employee?

Parents bring a great deal of wisdom and experience to the workforce and contribute to a diverse and inclusive culture. No one should feel pressured to apologize for being a parent or caregiver. Instead, embrace the multiple roles you embody and take a few pointers from some of GitLab's employees who are both remote workers and parents/caregivers.

Create and reinforce supportive values

At GitLab, we have an operating principle that clarifies family and friends come first, and work second. Our Diversity, Inclusion & Belonging value includes an operating principle to make family feel welcome.

Parents will only get so far in juggling work and parenting without organizational support. It is vital for leaders to create values and workplace flexibility such that a parent does not feel pressured to choose work over family on an ongoing basis.

Create a forum for sharing

GitLab expires all Slack messages after 90 days as a remote-first forcing function. This serves multiple purposes.

1. It forces work to begin and end in GitLab (the product)
1. It lowers anxiety often associated with chat tools by reinforcing a bias towards asynchronous workflows
1. It reminds employees that the tool's primary function is informal communication, where parents can converse about challenges and solutions related to parents. (We're humans first, colleagues second!)

GitLab has several Slack channels where parents can ask questions, share challenges/tips/advice, and offer recommendations. This may include homeschooling programs, useful apps, or suggestions for staying sane during a global pandemic. Companies should consider creating similar. GitLab's Juicebox Chats have been a delightful tool for encouraging cultural exploration for kids while at home during COVID-19.

1. intheparenthood (Join Slack channel - for GitLab team members only)
1. kid-juicebox-chats (Join Slack channel - for GitLab team members only)

It also serves as a forum to share photos, videos, and stories (depending on one's personal comfort level). As an all-remote team, these serve as windows into the worlds of coworkers and can go a long way in lifting one's spirits and building bonds amongst parents.

Share your schedule

{style="max-width: 50%;"}

Consider sharing your work calendar with family. This can be done via a subscription to one's digital calendar, having a screen in a common living space that mirrors one's work calendar, or via handwritten notes affixed to the refrigerator.

By knowing when a parent is in a meeting or heads-down in focus time, it relieves the burden from the parent to continually update family on their status.

Busy/available indicators are useful for creating a visible way to show family when you're available/unavailable.

No-meeting days and mid-week days off

For team leaders, consider piloting a no-meeting day company-wide (or team-wide) to allow more space for time with children while working remotely. At GitLab, several parents are also shifting their schedules to take a weekday off entirely. In remote settings where more work is conducted asynchronously, it is more feasible to work an unconventional schedule to accommodate children.

Embrace a non-linear workday

{style="max-width: 50%;"}

If your work environment allows for it, consider flexing your workday around your kids' schedule(s). This enables you to be present for moments during the day that would be impossible to access if commuting to an office.

Learn more on embracing a non-linear workday.

Use Slack/Teams statuses to manage ad hoc needs

With just one or two clicks, you can modify your status on Slack or Microsoft Teams to indicate that you're unavailable. Consider a stop sign, a family emoji, or an alternative that you're comfortable with. This gives your remote coworkers an at-a-glance indication that you're away. You need not go into detail as to what you've had to break away and manage at home. A simple status icon goes a long way in conveying availability and empathy.

Optimize for open space in your calendar

Being booked at 100% is a risk, particularly for working parents. (See Kingman's Formula for the mathematics behind this.) The ebbs and flows of life cannot be predicted - after all, it's impossible to know everything. If your standing commitments have you at 100%, you have no room to react thoughtfully to life/children, or to plan for improvements.

Stress is contagious, but so is calm. Be ruthless in declining meetings and conveying that your schedule is full once you reach a certain quantity of daily or weekly meetings.

Expect the unexpected

Planning and preparation is wonderful, but as any parent knows, each day brings a set of challenges that are impossible to fully hedge for. Open, honest, transparent conversation with one's manager and team is vital to ensuring that hiccups are met with less stress and anxiety. Communicating one's realities is important to keeping a team on track and adjusting due dates and milestones accordingly.

Q: How do you manage employees working from home with kids?

Much of the how to be a great remote manager applies to any and all remote-work situations. However, a truly great manager is able to adapt to their employees' work/home/life situations and be willing to iterate accordingly.

Some best practices for motivating remote employees balancing caregiving include:

- Prioritize impact over activity
- Don't require people to have consistent set working hours or say when they're working
- Don't encourage or celebrate working long hours or on weekends
- Encourage teamwork
- Say thank you often

Q: What are some final thoughts on work from home parenting?

It's not impossible to work from home while being a parent or caregiver; it's inevitable. These two anecdotes from GitLab team members will help you understand how to make the best of both

worlds.

> What has worked for me is to integrate GitLab into my life, and not the other way around. I set very clear boundaries in my calendar of when is work time and when is family time. Per GitLab's recommendation, my calendar is viewable by anyone and clearly has time for: kids test prep, visual therapy for one, judo pick-up and other appointments I have outside of work. This prevents team members from scheduling over these instances.

>

> If someone does schedule over family time or personal time, I feel confident to decline, unless it is very urgent and I'm blocking it (I always suggest a new time first, before using family time for a meeting). I am also inclined to say that if folks keep scheduling outside of your work time, to make sure you respond back and highlight that, and check if you can find an alternative time that works for both of you. · Nadia V.

>

> When I joined GitLab, it was great to see things in people's calendars like baby time, homework with kids, date night, etc. Part of onboarding was coffee chats so I saw these "meetings" on calendars as I tried to schedule chats. It reinforced our family first operating principle, and also normalized these activities. It helped me understand that I could set up similar boundaries and not sacrifice bed time or something similar just to have an empty hour on my calendar. · Seth B.

Contribute your lessons

GitLab believes that all-remote is the future of work, and remote companies have a shared responsibility to show the way for other organizations who are embracing it. If you or your company has an experience that would benefit the greater world, consider creating a merge request and adding a contribution to this page.

Return to the main all-remote page.

SECTION: company/culture/all-remote/people.md

<!-- markdownlint-disable MD013 -->

On this page, we're spotlighting brilliant, creative, passionate people who have adopted a remote lifestyle.

New possibilities and freedoms

{{< youtube "QTPeyRW766Q" >}}

In the GitLab Unfiltered video above, two GitLab team members share their experiences on working in an all-remote setting, providing a glimpse at what's possible when embracing this style of work.

All-remote and remote-first organizations enable lifestyles that simply are not possible in colocated companies, where a daily commute and one's physical presence are required.

When you're free to choose when and where you live and work, your work can revolve around your life as opposed to the other way around.

All-remote and remote-first organizations tend to attract people who place a high degree of value on autonomy, flexibility, empathy, and mobility. It also presents outsized opportunity for people who must live or prefer to live in rural areas, where well-paying careers in technical industries are few and far between.

Below, we're detailing examples of people who have adopted a remote lifestyle. If these resonate with you, chances are high that you would receive a great deal of fulfillment in an all-remote or remote-first company. Similarly, if you're an employer yearning to hire sharp, driven, passionate people like the below, consider going all-remote in your own company.

Travelers

Individuals with an innate sense of wanderlust are apt to gain fulfillment in an all-remote or remote-first role. Having the freedom and flexibility to travel at will and work from anywhere in the world with a solid internet connection is a tremendous perk for those who don't want to sit still, yearn to explore new cultures, and collect new passport stamps.

It's important to note that you aren't required to have audacious travel goals to appreciate an all-remote setting. Those who simply appreciate the ability to visit friends and family on occasion · or jump on excellent flight deals to new locales · without lobbying for additional vacation may be suited for all-remote.
