

n one's vest pocket, he also alluded to wireless communications that would become the foundation for enabling conditions suitable for an all-remote company to thrive. A portion of the interview is below.

> "When wireless is perfectly applied the whole earth will be converted into a huge brain, which in fact it is, all things being particles of a real and rhythmic whole. We shall be able to communicate with one another instantly, irrespective of distance. Not only this, but through television and telephony we shall see and hear one another as perfectly as though we were face to face, despite intervening distances of thousands of miles; and the instruments through which we shall be able to do this will be amazingly simple compared with our present telephone. A man will be able to carry one in his vest pocket.

>

> We shall be able to witness and hear events—the inauguration of a President, the playing of a world series game, the havoc of an earthquake or the terror of a battle—just as though we were present."

Sir Arthur Charles Clarke

Arthur C. Clarke was a writer, inventor, and futurist.

{{< youtube "FxYgdX2PxyQ?start=104" >}}

In this BBC Horizon clip, which originally aired in 1964, Clarke predicts that in or around the year 2000, working remotely by leveraging advanced telecommunications will be possible. A portion of his interview is transcribed below.

> "I'm thinking of the incredible breakthrough which has been made possible by developments in communications; particularly the transistor, and above all, the communications satellite. These things will make possible a world which we can be in instant contact with each other, wherever we may be, where we can contact our friends anywhere on Earth, even if we don't know their actual, physical location.

>

> It will be possible in that age, perhaps only 50 years from now, for a man to conduct his business from Tahiti or Bali just as well as he could from London. In fact if it proves worthwhile, almost any executive skill, any administrative skill, even any physical skill could be made independent of distance. I am perfectly serious when I suggest that one day we may have brain surgeons in Edinburgh operating on patients in New Zealand."

Robert Noyce

Robert Noyce is known as "the Mayor of Silicon Valley," or "Statesman of Silicon Valley." He is Intel's co-founder and the co-inventor of the integrated circuit.

{{< youtube "VG2jwWtjyXU" >}}

In this Tomorrow/Today clip, which originally aired in March of 1981, Noyce posits that as computing power becomes less expensive and more attainable, it will free workers from the burden of traveling to work. His thoughts have proven prescient, and his foresight is particularly impressive given that it predated the modern internet. A portion of his interview is transcribed below.

> "If I look out on the road there, we find most of the cars that are driving by are not carrying goods. They're carrying brains. Trying to take the brain to the place where the work is to be done. With modern communications, and the extension of what we can see in communications, and in computer power · in getting information transferred back and forth · there is no reason why you could not carry on this interview at home, at your office, with me at my office, etcetera.

>

> And I think that as we look farther into the future, we're going to find that people will live where it is conducive to live. Not where it is conducive to work. That the movement of the work to the individual will be much easier, because, as I say, most of our people are doing knowledge work, not work with physical materials.

>

> So, at least that half of the population · today's population · could work wherever they please. Without any limitation that they have to go into a particular point to do their work. As long as the communications and the information is available to them wherever they happen to be.

>

> Wouldn't you rather work in Hawaii?"

<p>GitLab's six values · Collaboration, Results, Efficiency, Diversity, Inclusion & Belonging, Iteration, and Transparency · are detailed in the company Handbook.</p>
</div>
<div data-bbox="114 685 767 718" data-label="Text">
<p>While all-remote isn't a value itself, it's something we do in order to practice the aforementioned values.</p>
</div>
<div data-bbox="114 734 907 801" data-label="Text">
<p>To be effective, and to impact culture in an ongoing, meaningful, sustainable way, values must be more than words written on a page. Values must be lived, with each day representing a new opportunity to refamiliarize oneself with said values and strive to implement them in every professional interaction.</p>
</div>
<div data-bbox="114 816 915 868" data-label="Text">
<p>It also means lending a hand and speaking up when you believe certain values are not being lived out. Apathy towards company values leads to cultural degradation and dysfunction. Values can only shape an organization if they're respected and lived by each team member.</p>
</div>
<div data-bbox="114 883 811 902" data-label="Text">
<p>This is particularly meaningful in an all-remote setting. With less physical interaction,</p>
</div>

there's less buffer to compensate for indifference towards company values. Team morale is closely linked to the overall respect given to values.

Two, an overarching belief in a company's values contributes to less ambiguity in decision making. Respected values serve as a universal north star, aligning team members on how to address any challenge or disagreement, even when there's debate related to approach or outcome.

There's as much to unlearn as there is to learn

{style="max-width: 50%;"}

As aptly stated in Basecamp's Handbook, there's as much to unlearn as there is to learn when it comes to living out values in a remote role.

It requires company-wide trust that team members have permission to drop prior organizational baggage and truly operate differently, which may feel like a trap for those who have been exposed to traditional bureaucratic norms.

Psychological safety is critical, and leadership should place a high degree of importance on ensuring that this does not erode. GitLab signals the importance of this by listing "Loss of the values that bind us" as one of the concerns on the Mitigating Concerns page.

Values should not be a surprise

Sharing company values should be a requirement to hire. Prospective applicants should find a link to a company's values on each job page, enabling them to ingest that information prior to applying.

Open, honest, transparent conversation about company values should be a part of the interview process. This is true for all companies, all-remote organizations included. It's not fair to candidates to talk about day-to-day tasks without mentioning the values that guide culture and decision making. It's not fair to existing team members of a company to hire people who aren't aware of company values, and may not be inclined to live them on an ongoing basis.

All-remote contributes to fewer surprises by forcing companies to be more transparent. With fewer visual cues and in-person interactions, all-remote companies rely on each team member to operate while being mindful of company values.

It's critical that values be understood as early as the interview process, reiterated during onboarding, and reinforced daily through informal communication practices, 1:1s, meetings, and execution of job responsibilities.

Collaboration

{style="max-width: 50%;"}

Collaboration should not be conflated with consensus. By establishing collaboration as a value, and defining it clearly, this allows GitLab to function more effectively as an all-remote

company. When individuals and teams are dispersed geographically, it is imperative for collaboration to be active rather than passive.

In a colocated company, collaboration can occur spontaneously by being in a shared space and overhearing something that leads to a broader discussion. All-remote forces our team to not leave collaboration to chance. Rather, we embrace collaboration and rely on the feedback of others to make improvements.

Given that it is impossible to know everything, all-remote offers a level playing field where any team member can approach any other team member to learn, seek input, or ask for advice.

We also want everyone to contribute - a notion with collaboration at its very core. All-remote ensures that decisions are made out in the open and documented.

GitLab Issues and Merge Requests enable all team members to chime in, with an understanding that the DRI (directly responsible individual) will make a decision.

Results

{{< youtube "AtfE4rB0kis?start=157" >}}

In the Bloomberg Technology interview above, GitLab co-founder Sid Sijbrandij describes how all-remote helps the company practice its values.

Valuing results enables a healthier all-remote atmosphere. By placing a genuine focus on rewarding outputs rather than inputs, all-remote teams have a shared desire to be excellent at their work, generate meaningful outcomes that move a business forward, and disengage with work as early as practical. All-remote teams are not incentivized to stay late for the sake of being seen.

Colocation can make this more difficult to get right. As people congregate in a shared space, humans naturally form opinions on those who they are in contact with more often. It becomes more difficult to separate actual business results with vanity metrics (e.g. being seen in the office late, or appearing in every meeting regardless of need).

All-remote teams are more inclined to remain focused on what actually matters at work, given that they have a constant reminder of what awaits them outside of work. There is no clock to watch or inescapable cubicle. When you're empowered to live and work in locations that are fulfilling, all-remote teams will strive for results as a means to spend additional time embracing their surroundings, family, community, hobbies, etc.

Efficiency

Efficiency is near and dear to an all-remote team. Part of what attracts many team members to an all-remote role is the desire to create a more efficient day, starting with the elimination of a commute and the possibility of relocating to a destination with a low cost-of-living.

Because time truly is your own in an all-remote setting (core to being a "manager of one"), you're incentivized to be respectful of others' time. It's easier to not mind wasting time in a colocated environment, where you're forced to be in the same building for a set number of hours

regardless of whether that is a wise use of your time.

Perhaps the most notable element of efficiency that contributes to a thriving all-remote team is documentation. All companies should strive to write things down · to document everything from meeting notes to quarterly objectives · but this is of particular importance for all-remote organizations. Documenting everything enables an ever stronger, more informed, more trusting, and more connected team, as there's no physical space to debrief in.

Valuing efficiency enables an all-remote team to work well asynchronously. In colocated settings, it's easier to delay an iteration until a future time "when everyone will be in the same room." All-remote teams realize that it's better to document and ask for feedback now, enabling team members to comment and contribute when it's convenient for them.

Diversity, Inclusion & Belonging

Valuing diversity, inclusion and belonging helps support an all-remote structure. By hiring globally, rather than asking people to relocate to a specific city, all-remote companies will naturally boast a more geographically diverse team. This enables a broader range of perspectives, ensuring that a business is evaluating its own efforts through more lenses.

All-remote means that you will not sacrifice career advancement by working outside of the office, and it creates a workplace where caregivers, individuals with physical disabilities, etc. are not disadvantaged for being unable to regularly commute into an office.

It also enables those who must relocate frequently for family and personal reasons (e.g. military spouses) to take their career with them, and allows movement and relocation to physical settings that contribute to an individual's health (e.g. moving to a location with an improved air quality index).

Iteration

{{< youtube "jYYxibs1Qg" >}}

In the GitLab Unfiltered video above, GitLab co-founder Sid Sijbrandij verbalizes how he discovered the value of iteration.

Referencing GitLab's time at Y Combinator, Sid shares that by iterating quickly, you're able to achieve more without working longer hours, thereby creating a more sustainable approach to work.

> There were people in the company, even at the time, who suggested that we should slow down. The response from GitLab has always been, "No, we'll get the most we can get done. The smaller we split things up, the smaller the steps we take, the faster we can go."

>

> We still believe that's true today. We want everyone comfortable with taking small steps without a lot of coordination, without a lot of predicting, and without a lot of explaining. ·
GitLab co-founder, Sid Sijbrandij

An embraced spirit of iteration helps maintain an all-remote culture. By encouraging small steps and empowering individuals to propose minimal valuable change, all-remote teams are less

burdened by the need for coordination.

Particularly as organizations scale, the friction of coordinating people and teams can lead to dysfunction and frustration. Coordinating large groups across an array of time zones is impractical, which forces an all-remote team to not lean on the coordination crutch.

This empowers all-remote teams to make small changes and reduce cycle times. This leads to changes which are easier to provide feedback on (and roll back if needed).

Valuing iteration creates a climate where there is a low level of shame. This is extraordinarily difficult to replicate in large colocated settings, where perception is often reality and decisions are swayed by physical appearances. In all-remote companies, this reinforces that a person is not their work.

{{< youtube "EuGsen3FxXc?start=2209" >}}

In the GitLab Unfiltered video above, GitLab co-founder Sid Sijbrandij verbalizes how iteration applies to non-reversible decisions.

> This idea of iterating works very well when the initiative can be reverted in case it doesn't work.

>

> There's a concept of one-way and two-way doors. If it's a two-way door, you can just return. Don't think long about the decision, just go.

>

> A decision to integrate two applications into one, for example, is a one-way door. That is many months of engineering work. It's a very big deal.

>

> In that case, you try to do more homework, collect more data, get more opinions, and debate it longer. The trick with iteration is to split it up, and very often you can split things up more than you'd initially think.

>

> Challenging people on their thinking [as it relates to iteration] is one of the main things that we can do as management of GitLab. · GitLab co-founder Sid Sijbrandij

Transparency

Transparency is simplest to implement when there is nowhere to hide. In all-remote companies, there's no hallway chatter, no secret elevator talks, and no locked boardrooms. All-remote companies require transparency to thrive. Every company should aspire to transparency, but an all-remote culture receives outsized benefit by achieving it.

At GitLab, we have regular, recorded meetings to discuss progress on each department's metrics and OKRs. This is an excellent example of transparency providing benefit to an all-remote culture. Team members are able to listen and learn when it best suits their schedule, and even those who work in functions outside of that team are able to gain a broader understanding of what matters to the company.

Return to the main all-remote page.

SECTION: company/culture/all-remote/remote-vision.md

{{< youtube "HhlqwJsNyM" >}}

In the GitLab Unfiltered video above, Darren (GitLab) and Anna-Karin (Because Mondays) discuss a number of challenges and solutions related to remote work, transitioning a company to remote, working asynchronously, and defaulting to documentation.

There are a few important outcomes we expect to see as remote work becomes even more prevalent around the world:

1. The majority of new startups intentionally form as all-remote companies.
1. Cities in developing countries, particularly in Africa, enabled by all-remote jobs at companies founded by local leaders.
1. Most startups in the Bay Area with a significant portion of their workforce working remotely.
1. Increased wages for remote work outside of metro areas.

Diminishing competitive advantage

{style="max-width: 50%;"}

Being able to recruit and hire from most countries in the world is a distinct competitive advantage for GitLab. We will judge our impact and legacy on the world by how we influence the proliferation of all-remote companies.

We are hopeful that our hiring advantage will diminish over time. This will signal that all-remote is shifting toward being commonplace, with prospective employees having a broader selection of companies who offer such a structure.

We believe that a world with more all-remote companies will be a more prosperous one, with opportunity more equally distributed.

Why is this possible now?

We're nearing a tipping point with all-remote. Instead of remote teams having to justify why they do it, it's going to be colocated companies having to justify why they don't.

All-remote work wouldn't be possible without the constant evolution of technology, and the tools that enable this type of work are continuously being developed and improved.

We aren't just seeing these impacts for all-remote companies. In fact, in some organizations with large campuses, employees will routinely do video calls instead of spending 10 minutes to go to a different building.

{{< youtube "els71f5IEUU?start=468" >}}

In the above interview with Stuart Miniman of theCUBE, GitLab co-founder Sid Sijbrandij discusses the merits of operating a 100% remote organization, and why he believes it's the future of work.

> At GitLab, we're figuring out a lot of things you have to do to be all-remote, and we're trying to share those lessons. That's anything from working handbook-first to communication styles and being intentional about informal communication.

>

> If you Google "GitLab all-remote", you'll find tons of tips. And those are based not just on what we say, but what we do. We have a public handbook of over 3000 pages with all our internal processes. You can check out what we really do to make this work.

>

> I think it's going to be the future. In the future, companies who make digital products are going to be much more all-remote. And we want to enable that trend. We think it's great for team members.

Here are some of the key factors that make all-remote work possible:

- 1. Faster internet everywhere - 100Mb/s+ cable, 5GHz Wi-Fi, 4G/LTE/5G cellular
- 1. Video call software - Google Hangouts, Zoom
- 1. Mobile technology - Everyone has a computer in their pocket
- 1. Evolution of speech-to-text conversion software - More accurate and faster than typing
- 1. Messaging apps - Slack, Mattermost, Zulip
- 1. Issue trackers - Trello, GitHub issues, GitLab issues
- 1. Suggestions - GitHub Pull Requests, GitLab Merge Requests
- 1. Static websites - GitHub Pages, GitLab Pages
- 1. English proficiency - More people are learning English
- 1. Increasing traffic congestion in cities
- 1. More demand for flexibility from new professionals entering the workforce

SECTION: company/culture/all-remote/remote-work-emergency-plan.md

Due to global issues concerning COVID-19 (Coronavirus), many employees and employers are facing a new reality: they're remote, and they're unsure of when they'll be able to return to the office.

For leaders who are suddenly managing work-from-home teams, there are five things you can focus on right now to maximize stability.

(If you're an employee adjusting to a WFH reality, see our worker-focused starter guide.)

Untangling remote work and forced work-from-home

Tens of millions of people globally are experiencing a seismic shift in work. Many have been forced into their homes and asked to not only make do, but maintain or increase their productivity. For many, this is their first extended experience with work-from-home.

Globally, the narrative has neglected nuance, referencing the phenomenon as a global "remote work experiment."

It is neither remote work nor an experiment.

Being forced to work from home during a pandemic restricts all but a handful of remote work benefits. Losing the commute and making synchronous meetings more human are two perks which are felt, but the heart of remote work · the freedom to choose where you work, the ability to weave life into your work schedule, the opportunity to optimize your life for something other than proximity to an office · remains squashed.

Particularly for leaders who survey their workforce to understand their perspective on remote work, be intentional about highlighting this reality. Make a concerted effort to untangle "remote work" from "crisis-induced work-from-home." In asking someone if they would prefer to remain remote forever, for example, it's important to clarify that remote is fundamentally different than working from home while quarantined. Many workers may need assistance to visualize a remote future which is liberating as opposed to isolating.

Establish a Remote Leadership Team

{style="max-width: 50%"}

Shifting an entire division or company to remote triggers a shockwave of change. Evaluate current managers and rally a team of experts who have remote work experience, and are able to communicate nuances and serve as resources to those who will inevitably have questions. A core part of this team's role will be to document challenges in real time, transparently prioritize those challenges, and assign DRIs (directly responsible individuals) to find solutions.

Executive assistants may take on a more significant role in the transition, functioning as a documentarian in meetings and aiding with internal communications cascaded to the rest of the organization.

Establish a handbook

{style="max-width: 50%"}

This will be rudimentary to start, and will serve as a single source of truth for more pressing questions. Communicate this company-wide, and update it continually with DRIs for common questions around tools and access. This can start as a single company webpage or repository in Notion or similar tools, and will serve you well even after the current crisis subsides.

GitLab uses GitLab to build, sustain, and evolve its company handbook. GitLab is a collaboration tool designed to help people work better together whether they are in the same location or spread across multiple time zones. Originally, GitLab let software developers

collaborate on writing code and packaging it up into software applications. Today, GitLab has a wide range of capabilities used by people around the globe in all kinds of companies and roles.

You can learn more at GitLab's remote team solutions page.

One of the most sizable challenges when going remote is keeping everyone informed in an efficient way. Put concerted effort around systematically documenting important process changes in a central place to minimize confusion and dysfunction.

Establish a communications plan

Depending on team size, consider an always-on video conference room per team, where team members can linger, or come and go as they please. This simulation helps acclimation, enabling team members to embrace the shift to remote in a less jarring way. It also shows intentionality around informal communication · an important element that occurs spontaneously in an office, and needs an immediate replacement in a remote setting.

Whatever your current view on transparency, leaders should not hold back during this time. It's vital to maintain perspective through this shift. Everyone reacts to remote work differently, and not all homes are ideal workspaces. This can (and likely will) feel jarring, and team members will expect frequent updates as leaders iterate on their communication plan in real-time.

For a fast-boot on this front, consider replicating GitLab's public communication guide.

Minimize your tool stack

While functioning remotely, strip the tool stack down to a minimum. Google Docs, a company-wide chat tool (like Microsoft Teams or Slack), and Zoom are all you need to start. If your team needs access to internal systems through a VPN, ensure that everyone has easy access, and instructions on usage are clear.

Working well remotely requires writing things down. For companies who do not have an existing culture of documentation, this will prove to be the most difficult shift. Aim to funnel communication into as few places as possible to reduce silos and fragmentation. You'll want to proactively solve for mass confusion when it comes to finding things · policies, protocols, outreach mechanisms, messaging, etc.

Drive change

{style="max-width: 50%"}

Humans are naturally resistant to change · particularly change that is forced during times of uncertainty or crisis. Leaders will have to meet this reality head-on. An all-hands approach to recognizing the new reality is advised, and is vital to empowering everyone to contribute to the success of a remote model.

Particularly for companies with a strong "in-office experience" it is vital for leadership to recognize that the remote transition is a process, not a binary switch to be flipped. Leaders

are responsible for embracing iteration, being open about what is and is not working, and messaging this to all employees.

Managing a remote company is much like managing any company. It comes down to trust, communication, and company-wide support of shared goals.

{{< youtube "R0AB8ZvnEIU" >}}

In the video above, GitLab's Head of Remote shares his top tips for employees and employers who have been forced into a work-from-home scenario with Jack Altman, CEO of Lattice. Discover more in GitLab's Remote Work playlist.

Additional resources

We recognize that many companies are in need of establishing baseline remote principles right away. For those who wish to dive deeper, consider studying and implementing the guides below surfaced from GitLab's comprehensive guide to remote work.

- Pitfalls to watch out for when embracing remote
- Navigating the phases of remote adaptation
- Transitioning a company to remote
- How to use forcing functions to work remote-first
- Combating burnout, isolation, and anxiety
- Adopting a self-service mindset
- Remote Without Warning Webinar: How to adapt and thrive as a suddenly-remote company
- Preparing Your Team for Remote Work Webinar

{{% include "includes/isthisadviceanygoodremote.md" %}}

Contribute your lessons

GitLab believes that all-remote is the future of work, and remote companies have a shared responsibility to show the way for other organizations who are embracing it. If you or your company has an experience that would benefit the greater world, consider creating a merge request and adding a contribution to this page.

Return to the main all-remote page.

SECTION: company/culture/all-remote/remote-work-glossary.md

{style="max-width: 50%"}

While we strive to use low-context communication that doesn't require special knowledge to understand, at times we still rely on industry or GitLab-specific terminology for key concepts.

Here is a glossary of terms you may encounter in the handbook.

Like the rest of the handbook, this is a living document. Please add terms and improve the definitions on this page!

Asynchronous (async) work/communication

Asynchronous literally means "not at the same time." It's a term widely used in development, indicating a process where information can be sent at any time and processed at any time. In other words, the recipient of a message doesn't have to be present when the message is sent.

Making async communication work requires good processes. Read how we do it [here](#).

Colocated environment

In contrast to remote work, a colocated work environment is one where people inhabit the same space. A traditional office is a colocated environment. "Co-located" literally means "shared location."

Forcing function

A forcing function is any task, activity, or event that forces you to take action and produce a result. This term comes from interaction design, where it refers to a constraint that shapes behavior. At GitLab, we use forcing functions to empower and encourage team members to use best practices and to reinforce our values.

Handbook-first

Many organizations have a handbook for team members to access shared information on best practices, policies, and resources. GitLab has a "handbook-first" approach, which means that we treat our company handbook as a living document, constantly updated to remain the most current, single source of truth. GitLab team members are encouraged to look for answers and information in the handbook first, before asking.

Non-linear workday

Remote work enables employees to create their own schedules. As a result, remote teams may have individuals working nontraditional hours; taking breaks for family duties, exercise, entertainment, or errands; and having varying schedules from person to person, day to day, or week to week. This allows individuals to be more productive during their preferred working hours, while empowering them to be fulfilled in their personal lives.

is less predictable than a traditional workday. For a team to function well and permit non-linear workdays, it's important to have strong asynchronous communication practices.

Remote work

Work that can be done from any location. A "remote job" is a job that doesn't require the worker to go to an office or workplace. Remote work typically requires a reliable, fast Internet connection, appropriate equipment, and most importantly, good processes to empower the

employee and organization to be effective without relying on physical proximity.

See the stages of remote work: no remote, remote allowed, hybrid remote, and all-remote.

Single source of truth (SSoT)

This term comes from information systems architecture, but it's applicable in any environment where information is distributed. The concept is simple: there should be one central, accessible place where information is kept, and that source should be kept up to date. At GitLab, our primary SSoT is the handbook. We avoid creating new places to store information, so that when things change, only one document needs to be updated.

Working from home

This term is mostly self-explanatory, but it's important to distinguish from "remote work." Working from home is often a temporary or intermittent thing; some organizations permit team members to work from home one day per week, or to remain home during a crisis such as the 2020 pandemic. While remote work usually includes working from home, not all remote workers are always at home.

Low-context communication

At GitLab, we communicate with low context. We provide as much context as possible to avoid confusion.

Hybrid-remote

Hybrid-remote (which can be referred to as part-remote), is different than all-remote. In an all-remote company, there is no single headquarters, and each team member is free to live and work in any place they choose. Everyone, including executives, is remote, as there are no offices to come to.

All-remote

All-remote means that each individual in an organization is empowered to work and live where they are most fulfilled. By including the word "all" in "all-remote," it makes clear that every team member is equal. No one, not even the executive team, meets in-person on a daily basis.

Informal communication

In colocated environments, informal communication is naturally occurring. When individuals are physically located in the same space, there are ample opportunities to chitchat and carry on conversations outside of formal business settings.

Making social connections with coworkers is important to building trust within your organization. One must be intentional about designing informal communication when it cannot happen more organically in an office.

Phases of remote

As teams grapple with transitioning from a colocated environment to a remote one, it's common to see differing levels of adaptability. For some, the transition is fairly smooth, as a remote-first infrastructure was already established. For others, the shift is thoroughly disruptive.

Learn more on the phases of remote adaptation here.

<div class="col">
  <h3 class="h2 my-4">The contrast of perception and reality</h3>
  <p class="lead">There's a disconnect between the ostensibly high levels of satisfaction with remote work and the actual pain people are feeling day-to-day. While <strong>4 in 5</strong> would recommend remote working to a friend and <strong>81%</strong> of people are satisfied with the level of productivity, teamwork across organizations is struggling. Just over a third (<strong>37%</strong>) report that their organization does a good job of aligning work across projects.</p>
</div>
</div>
<div class="row my-5">
  <div class="col">
    <h3 class="h2 my-4">Transparency creates belonging</h3>
    <p class="lead"><strong>34%</strong> of respondents noted that more transparency from leadership leads to a deeper feeling of connectedness at work, while <strong>38%</strong> noted that more visibility into the work within the organization improved their sense of connection. Creating a sense of belonging within an organization is top of mind for many leaders. There's an interesting parallel between transparency and belonging. Put simply, it's easier to feel like part of a team when you can easily see what others are working toward.</p>
  </div>
  <div class="col">
    <h3 class="h2 my-4">Remote eyes the mainstream</h3>
    <p class="lead">This survey was limited to people who will continue working remotely post-pandemic. <strong>45%</strong> of these respondents reported less than a year of remote experience, meaning they started working remotely during the pandemic. This surge of new talent in the remote workforce pushes remote work closer to the mainstream, creating a large enough category that all organizations will be expected to have a formalized stance on workplace flexibility.</p>
  </div>
</div>
<div class="row my-5">
  <div class="col">
    <blockquote>
      <p class="display-5 my-4">If remote work was no longer an option, 1 in 3 would leave their jobs.</p>
    </blockquote>
  </div>
</div>
<div class="row my-5">
  <div class="col">
    <h3 class="h2 my-4">There's no putting the genie back in the bottle</h3>
    <p class="lead"><strong>82%</strong> agreed that remote work is the future of work, with nearly as many (<strong>80%</strong>) saying that they would recommend working remotely to a friend. This is particularly staggering given that crisis-induced work-from-home severely limits the benefits of remote work, and yet, the increased autonomy and loss of commute are powerful agents.</p>
  </div>
  <div class="col">
    <h3 class="h2 my-4">The office is a hard habit to break</h3>
    <p class="lead">Despite overwhelming positivity for more flexible work policies,
```

45% of respondents worry over not seeing colleagues in person, while **34%** are concerned about their ability to collaborate effectively. This spotlights an acute need for upskilling and development, with organizations now responsible for teaching their employee base how to collaborate across time zones and borders in an increasingly remote world.

Employers win, too

Increased productivity (**42%**) , increased efficiency (**38%**) , a reduction in bureaucracy and politics (**24%**) , and improved documentation and process (**20%**) were cited as top benefits to employers by enabling a remote environment.

A catalyst for diversity

Worldwide, women only make up about **38%** of the workforce. In remote work, they are the majority at **58%**. Too, **9%** of respondents self-reported as LGBTQ+ · significantly higher than the known global representation. However, respondents were overwhelmingly White, even in nations where they are an ethnic minority.

4 in 5 people would recommend remote work to a friend.

Next stop: burnout

42% of those surveyed admit that they struggle with maintaining boundaries while working away from the office. Leaders should proactively address this worrying trend by normalizing time away to recharge and prioritizing personal well-being in a visible way.

Coffee breaks go virtual

With travel restrictions in place, **33%** of remote workers saw their organizations lean on virtual coffee or tea breaks to foster a sense of community. Pair that with **27%** who cited virtual happy hours, and you've got a lot of video-based team building going on.

```

    <h3 class="h2 my-4">The documentation divide</h3>
    <p class="lead">Fewer than <strong>50%</strong> feel that their organization is doing
    enough to share company-wide goals, document processes, create communication standards, and
    promote visibility amongst workstreams. Barely a third believe their leaders are appropriately
    aligning work across projects.</p>
    </div>
    <div class="col">
        <p>&nbsp;</p>
    </div>
</div>
<hr>
<div class="row my-5">
    <div class="col">
        <h3 class="h2 my-4">Project background</h3>
        <p class="lead">This is the second annual Remote Work Report. GitLab's pre-pandemic,
        March 2020 report sought to look forward to the future of remote work; we now know that the
        future of work is distributed. We are no longer asking "if" remote can scale · now, we are
        seeking to understand how, what the challenges are, and what's next. This survey set out to ask
        new questions that will form the basis of global discussions in 2021 and beyond.</p>

In an all-remote organization, each individual is empowered to work and live where they are most fulfilled.

For many people, the preferred workplace is a home office. Of course, not all remote workers make their offices at home - but the majority do.

"Remote work from home" is any work that is performed in an individual's home, on behalf of an organization that may or may not have physical offices.

How do I set myself up to work from home?

Ultimately, the best way to work remotely depends on your personal preferences. However, many aspects of home working are more or less universal. Here are five approaches that are likely to boost your remote work-from-home proficiency.

1. Create a dedicated workspace (achieve focus)

Where you work is as important as what you work on and who you work with. Having a defined space helps usher you into an area of focus. While it is ideal to dedicate a room for work, if that is not possible, you can do something simple like hanging a curtain to block off a place of work.

Once you have created your workspace, focus on ergonomics for a healthy setup. Ask your employer if they will reimburse you for items such as chairs, noise-canceling headphones, monitors, external keyboards, etc. that promote a healthy and focused workspace. Try not to compromise on comfort. You may be able to work uncomfortably temporarily, but your productivity, health, and mood will likely decline over time.

For a full list of home office optimizations, visit GitLab's guide to a productive home office.

In this video, GitLab's Head of Remote Darren Murph talks to Sprinklr's Andrew Kasier about creating an office that allows for deep focus and work. Discover more in GitLab's Remote Work playlist.

{{< youtube "uP0aiei0JKA" >}}

Discover more in GitLab's Remote Work playlist.

2. Separate work from life (prevent burnout)

When you're working remotely from home, it can be difficult to set boundaries between work time and ... everything else.

This is likely to be the most difficult hurdle to clear, particularly for new work-from-home employees who have family in your home during your work hours. You should have a dedicated conversation with family, helping them understand that just because you're home, doesn't mean you're available.

On the other hand, when there's no physical office to leave, it's tempting to work longer than is expected (or healthy). Proactively planning what you'll do with your commute time is key to ramping into a workday as well as ramping off. You can set reminders to begin and end work or pre-plan activities during the void previously filled by a commute. A daily schedule will look different for each individual, but leaving your home for a walk or a planned activity with friends/community may be a great way to create clear work/life separation.

GitLab has created this extensive guide to combating burnout, isolation, and anxiety in the remote workplace.

3. Regularly engage with others (avoid loneliness)

When there is no office to spark spontaneous informal communication, you must be intentional about weaving it into your day.

- Schedule regular coffee chats with people using a video call.
- Experiment with audio-based chat tools like Yac and video-based tools like Loom.
- Create an always-on video conferencing room that your team can work from. (In a remote setting, it's OK to look away!)
- Talk about what you normally would. If sports, vacation plans, and hilarious tales of insubordination by children are common water-cooler material, work with your team to establish a chat channel to discuss things outside of work. The medium may be different, but the connection is the same.
- Drop any shame or embarrassment. Don't worry about your background, and feel welcome to let your pets and family find their way into calls on occasion. It humanizes the experience and reminds everyone that we're people first, and colleagues second.
- Connect with family and community. Working from home allows you to spend time with a different set of people than just your coworkers. Look for opportunities to build bonds with family and community, which may have been impossible or limited when you had a commute.

4. Respect the routine, but try new things (find structure)

One of the benefits of remote is the ability to experiment with unconventional working days. Not everyone shares the same peak hours of energy and focus. For example, if you work best in late evenings, let your team know you are going to try some non-linear workdays.

You can maximize the benefits of asynchronous workflows in an all-remote situation if you fill your former commute space with things that make you healthier like exercising, resting, bonding with family, cooking, reading, studying, etc.

5. Embrace change (allow iteration)

Relax: you aren't born knowing how to work from home. You cannot copy an in-office environment and paste it into a remote one and expect everyone to function as usual. Transitioning to remote is a process. When done well, a transition to remote avoids serious harm operationally as well as culturally.

It's important to overcommunicate with your team as you adjust.

- Ask questions
- Offer solutions for communication gaps
- Seek advice on how others have set up their workplace
- Crowdsource advice from within your organization
- Look for opportunity in the midst of the chaos.

What's the role of office spaces in a remote world?

{style="max-width: 50%"}

As organizations around the globe have embraced various models of remote or hybrid work, a new question has emerged: What do we do with our office space? Business leaders and facilities teams must decide what their top priority will be for these physical spaces.

This question is also relevant for owners and investors in commercial real estate spaces that have traditionally been used as corporate office space. How do we optimize these spaces in this new world of remote and distributed work?

We'll explore a number of options on this page, as well as highlight examples from organizations and property owners that have already repurposed their physical offices.

Closing the office

If you're a business leader whose team is transitioning to an all-remote model, the first option to examine is whether you can (or want to) close some or all of your office spaces. This sends the clearest signal that you're fully embracing remote work. It's likely to be the most cost-effective approach, and will eliminate the potential for the office to remain a crutch to collaboration.

This may not be a feasible option for some organizations in the short term due to leasing terms and other binding factors. That's why we'll explore other ways to repurpose this space, both for organizations and the owners of the spaces.

Repurposing office space

For organizations that plan to retain some or all existing office space, there are a number of ways to redesign and use these spaces more effectively to enable better remote-first collaboration, social and team building, and even community connection.

Ask for input from your team

Gathering input from your employees is an important first step in the decision-making process to determine the future use of your office space. This is especially key data if you're embracing a hybrid work model. There's no "one size fits all" for workspaces, remote or colocated. Knowing your team's current needs and preferences for this space can help prioritize what features you invest in and ensure it's a productive space that serves your organization into the future.

{style="max-width: 50%"}

Make office space more remote-friendly

Companies that were mostly colocated prior to the COVID-19 pandemic likely prioritized desks, hoteling workstations, and meeting spaces with the assumption that most work would happen within the walls of the office. Those spaces are in need of an upgrade in order to truly embrace your new remote-first or hybrid organizational design.

The goal should be to ensure the office is treated as simply another space to work remotely.

Here are some changes to consider to make your space more inclusive of remote team members:

1. Eliminate and/or redesign meeting rooms for individual hybrid-remote meeting spaces
1. Install an LCD wall (or similar) with images and photos from remote team members to serve as a reminder of your team beyond the office
1. Ensure that hoteling or co-working areas are prioritized within the office over dedicated desks or large cubicles
1. Upgrade video conferencing technology in all meeting spaces to avoid the downsides of hybrid calls
1. Include reminders in meeting spaces about your documented, remote-first meeting norms
1. Incorporate digital signage for internal communications campaigns and promotions so that

remote team members have access outside of the office

Turn the office into a social gathering space

For remote or hybrid teams, time spent together in-person is most valuable when used for social connection and team building.

Most traditional office spaces have some kind of gathering space for employees, but it typically doubles as a cafeteria, break room, gaming area, or large conference room. These spaces often have capacity limits that prevent them from being able to accommodate the entire team for company celebrations and social events. Take your unused cubicle or "work only" space and convert this part of your office footprint to serve the emerging needs of your organization for social spaces of all sizes. Examples of these new spaces include:

- 1. Assembly theaters
- 1. Event ballrooms
- 1. Music studios
- 1. Libraries
- 1. Fitness studios
- 1. Walking paths or ramps for active "walk-and-talk" meetings

These changes will enable your team to shift your collective mindset around the purpose of the office and establish the remote-first practices that allow work to happen from anywhere.

Convert the office to a community hub, co-working, or innovation space

{style="max-width: 50%"}

If you're an organization that invests in local entrepreneurs, innovation projects, or service-focused initiatives, you can use your existing office space to support those investments.

This is also a community-focused option for real estate owners who no longer have corporate tenants occupying spaces that were previously outfitted for offices.

Co-working and networking spaces can become hubs for entrepreneurs and startups looking to connect with their community without an expensive investment in office space. Some co-working spaces even specialize in supporting specific audiences. For example, these co-working spaces around the world provide on-site childcare for working parents.

Examples of companies repurposing office space

These companies have already taken innovative approaches to how they've reduced or reinvented their office space to support their team's needs for the future. This is not an exhaustive list, and we encourage contributions to it.

- Cimpress/Vista: Shifted to a remote-first model and reduced their overall office footprint. They're turning remaining offices into collaboration centers for team members to gather.
- Atlassian: Transitioned a "TEAM Anywhere" distributed model. The company redesigned its Austin office to be more equipped to support both remote and in-office employees.

- Hubspot: Shifted to a hybrid model that allows team members to choose from three primary work environments: home, flex, or office. They redesigned their offices to better serve "flex" and "office" employees, while working to make their perks and benefits location agnostic.
- Amazon: Partnered with a non-profit organization to turn one of its headquarters buildings in Seattle into a homeless shelter and community support center.

Alternative uses for office space

Here are other examples that owners of commercial office space could consider in lieu of corporate tenants in their spaces outfitted as offices. This is not an exhaustive list, and we encourage contributions to it.

- Residential space
- Affordable housing
- Gyms
- Classrooms and learning centers
- Vertical and container farms
- Warehouses and distribution centers
- Mixed-use buildings that meet both living and working needs
- Co-working spaces

Invest in your team's remote workspaces

{style="max-width: 50%"}

Reducing or eliminating corporate office space is likely to bring cost savings to your organization. Keep in mind that just because you no longer have to invest in physical real estate does not mean you have no need for a workspace-related budget. The onus is on business leaders to provide the space and equipment their employees need to create healthy and productive remote workspaces. As this continues to become the norm for remote and hybrid workers, top talent will expect this as a requisite part of any total rewards package and employee experience.

You can find more guidance on how to invest in your team's workspace in this guide.
