

t Marketing team plan

- CMO: Hire Director, Corporate Marketing
- CMO: Hire to Corporate Marketing team plan
- CMO: Hire Director, DevRel
- CMO: Hire to DevRel team plan
- MSD: Hire to SDR team plan
- MSD: Hire SMB Customer Advocates
- MSD: Hire Manager, Online Growth
- MSD: Hire to Online Growth team plan
- MSD: Hire to Field Marketing team plan
- CCO: Launch training for making employment decisions based on the GitLab Values.
- CCO: Ensure candidates are being interviewed for a fit to our Values as well as ability to do the job, through Manager Training and Follow-up by People Ops.
- CCO: Analyze and make recommendations based off of New Hire Survey and Pulse surveys which will drive future KRs. Have at least 3 areas to improve each quarter. Ideally, we will also have 3 areas to celebrate.
- Issue
- Issue
- CCO: Iterate on the Performance Review process with at least two changes initiated by March.
- CCO-TA: Iterate the hiring process to decrease process cycle-times, increase efficiency on screening candidates and provide a better candidate experience.
- CCO-TA: Re-vamp and enhance our jobs page to help attract diverse quality talent enhance our employment brand and position ourselves as hi-tech company.
- CCO-TA: Establish level of effort metrics to ensure process efficiencies to include: recruiter screened/hiring manager review ratio, Interview/Offer ratio, and Offer Accept ratio.
- CCO: Provide consistent training to managers on how to manage effectively. Success will mean that there are at least 15 live trainings a year in addition to curated online trainings.
- CCO: Align recruiting to Functional Groups with Focus on Low Rent Regions. At least 50% of GitLab team-members should be hired from a Rent Index location that less than 0.7.
- CCO: Implement actionable recruiting Metrics, including the ability to track an accurate source of hire for the majority of all hires.
- CCO: Target 2 Diversity recruiting Events/sources to attend and recruit from. Measure success to determine future plan.
- CCO: Increase Employee Referrals by 5%.
- CCO: Launch Harassment Prevention Training to all managers.
- CCO: Identify the right LMS for GitLab.
- CCO: Now that hiring managers have been trained on Reference Checking, beginning ensuring that Hiring Managers are verifying at least one reference per hire personally.
- CCO: Hiring at least one sourcer and one recruiter for EMEA/Central Asia.
- CCO: Prioritize the future countries for increased hiring based on pipeline, regulations, future sales, rent index. Begin steps to enable increased hiring outside the U.S.

Retrospective

VPE

- GOOD
- Q2 OKRS launched on time
- Hiring plan and budget on-time and in-line

- Hired and on boarded a director of eng (Tommy)
- Q1 GitLab.com availability/stability was good (although not as good as monitoring indicates)
- BAD
 - OKRs we tweaked mid-quarter and Sid and I never syncd on the changes, so some things never got attention
 - GitLab.com did not move to GCP
 - Didn't get to the local handbook set up video
 - Slow progress overall on hiring
- TRY
 - Double down on hiring Dir of Infra, treat as exec hired
 - Partner with people ops to increase hiring pace
 - Less KRs in Q2 to increase focus

Platform

- GOOD
 - Deliverable hit rate has been pretty consistent.
 - We resolved all Security SL1 issues.
 - We triaged all Platform Community Contribution MRs.
- BAD
 - We consistently overpromised what we could deliver in a release. This was done in accordance with earlier statements that OKRs should be ambitious and that if we hit more than 70% of our OKRs, we weren't ambitious enough, though.
 - We did not resolve all Support SP1 and Availability AP1 issues.
 - We didn't take over any of the popular "coach will finish" Community Contribution MRs.
 - We didn't hit our bug target, and actually fixed fewer bugs with each release.
 - Bug target was too low. If we had hit our target, the total backlog size would have stayed approximately constant, but because we didn't, it actually increased by 17.
 - Not much progress was made on backup/restore integration tests.
- TRY
 - Putting a limit on the total weight of Deliverable issues so that we can actually deliver all of them, and using the Stretch label for issues we'd like to start on this release, but are fine with letting them slip and get finished in the following release. (See gitlab.com/2022)
 - Specifically allocating time to finish popular Community Contribution MRs, by making their issues Deliverable and not allowing them to slip.
 - Specifically allocating time for Engineering-driven efforts like improving integration tests, by making their issues Deliverable and not allowing them to slip.
 - Finding a better balance between adding new features and fixing bugs in existing features.
 - Adding people to the team to be able to do the 3 items above without significantly interfering with our Product feature output.

Discussion

- GOOD
 - All top-priority security, support, and availability issues were addressed.
 - Deliverable hit percentage increased to 100% over the quarter.
 - Hit bugs target early.
- BAD

- Missed a big issue (Rails 5), due to staff changes.
- Bug target was too low (backlog only reduced by 11 issues).
- Didn't address all of the oldest community contributions we have.
- Deliverables target ignores an issue, batch commenting, that has been blocked on frontend since January.
- TRY
 - Not having OKRs for specific priorities, if we also have OKRs for solving issues of a particular type.
 - Better tracking of issues that made it / missed per release:
 - All backend issues.
 - Deliverables.
 - Bugs
 - Performance issues.

Distribution

- GOOD
 - Delivered all scheduled OKRs, and added one more during the quarter
 - Recognized challenging parts of the tasks and reduced scope in time, which allowed us to move quicker towards the goals
 - Managed to tackle some Technical Debt as part of the OKR tasks
- BAD
 - Everything that was not an OKR was secondary
 - The scope of the OKR's might have been too ambitious
 - Basic integration coverage meant that we had two serious regressions
 - Cloud Native charts taking most of the teams bandwidth
 - Less amount of time spent on hiring than what was expected
- TRY
 - Establish a better ratio of technical debt vs. features shipped in one release
 - Focus on sourcing more candidates
 - Establish a better way of assigning engineers to their tasks instead of encouraging them to choose from milestone

Monitoring

- GOOD
 - Shipped all GCP required features.
- BAD
 - Dropped/didn't update alerting KR to reflect feature scheduling changes.
- TRY
 - Work on hiring to improve team throughput.

UX Design

- GOOD
 - Major challenges/opportunities for Auto DevOps installation flow identified.
 - Roadmap for Auto DevOps installation improvements established.
 - All design pattern issues completed or in final review.
 - Understand who operations/DevOps engineers are, most common tasks/duties, the metrics they're tracking.

- Identified DevOps biggest challenges: lack of automation, culture, resource, and tools.
- Updated and recorded all UX standards covered by the current UX guide.
- Added many UX standards not documented in the current UX guide.
- BAD
 - OKRs for Q1 not finalized in December and re-tuned at the end of January, delaying progress.
 - Hiring took up much of the UX team's time early in Q1.
 - Poor priority management, put design library issues off as the deadline was further out and other OKRs were more pressing for the company.
 - Dependence on other departments for scheduling and review of some issues. Unable to influence progress once they were out of our hands.
- TRY
 - Finalize OKRs earlier on so we can plan better.
 - Assign UX designer to issues rather than encouraging them to pick them up.
 - Schedule UX OKR issues into milestones to make sure we stay on track.
 - Continue to use epics to drive goals and initiatives.
 - Streamline the hiring process for UX to make it more efficient.

Support Engineering

- GOOD
 - New hires on boarded quickly and successfully
 - Services is gelling
 - HA & Kubernetes expertises went well
 - No attrition
- BAD
 - We did not hire to 100% of plan
 - SLAs for premium and ultimate fell short of our standard
- TRY
 - Hire a director of support
 - Pick up pace of engineer and agent hiring

Security

- GOOD
 - Resolved all SL1/SL open issues in CE tracker.
 - Conducted successful security assessment on Gitaly.
 - Mean Time To Remediation for new open security vulnerabilities is now below industry standard of 30 days.
 - Started conducting internal security briefings on a biweekly basis to drive company-wide accountability and sense of urgency on all security issues.
 - Successfully drove GitLab's new pages domain verification mechanism.
 - From a technical security standpoint, completed all requirements for GDPR compliance.
 - There is now a formal data classification policy.
- BAD
 - Although we are doing well with new open security vulnerability issues, there remains a security debt of old security issues to resolve.
 - FIPS 140-2 effort needs more work, and we did not get as far along in that process as we wanted to, due to reliance on 3rd party partner.
 - We were not able to get as far along in application security reviews, due to other efforts

taking higher priority (e.g., remediating new open issues, security release process efforts).

- TRY

- Revisit FIPS 140-2 effort to see how we can take on more of the burden internally.
- We will work to reduce security debt in the old open security issues.
- Conduct more outreach to Engineering departments in order to get more application security reviews conducted.

Frontend

- GOOD

- New team members were overall onboarded well
- Reduced Technical Debt a lot through different topics
- Constant improvements on our workflows and tools
- Delivered a lot of big features

- BAD

- Missed the deliverable percentage goals
- Vue-based MR's not live yet. This turned out to be far larger than anticipated and had to be re-planned.

- Too long and too much discussions for specific topics
- CSS Refactoring underestimated, had to re-plan
- Hard to estimate velocity, lead to slipped deliverables
- Hard to schedule with an unclear task at the beginning
- Didn't invest enough time on Community Contributions

- TRY

- Drive longer planning with Epics + bigger scheduling gates for issues
- Optimize planning pipeline together with PM's
- Domain experts to take over domain expertise in the FE team
- Frontend Sub teams
- Skipping CSS Refactor and go straight for reusable Vue Components
- Extend tooling and improve Workflows
- Set up a workflow to check community contributions as an actual task by someone every release cycle

Infrastructure

- GOOD

- We simplified the GCP project by moving to a life-and-shift strategy

- BAD

- Hiring did not keep pace
- We do not have a project management framework that has taken

- TRY

- Pick up hiring
- Experiment with project management frameworks
- Better monitoring of GitLab.com for SLA

Database

- GOOD

- We managed to achieve more compared to our previous OKR, both by having more manpower and by planning work more carefully.

- BAD
 - We didn't get as much workflow related work (e.g. Apdex scores) done as we'd like.
- TRY
 - For the next quarter we will be hiring a database manager and hopefully also a database engineer. This should further reduce load on the existing team members.

Production

- GOOD
 - GitLab.com availability in Q1 was better than 2017 average
- BAD
 - Team attrition
 - Did not move to GCP
 - Did not hire a production engineer
- TRY
 - Better GitLab.com monitoring for uptime

Gitaly

- GOOD
 - Hit early milestones
- BAD
 - We did not stay on pace with our backlog for Gitaly v1.0
 - OKRs were messy and possibly redundant
- TRY
 - More project mgmt
 - Clearer KR, less for more focus?

Geo

- GOOD
 - We migrated most projects, attachments, LFS objects, etc. from GitLab.com to Google using Geo.
 - We found and fixed a significant amount of issues in this process.
 - We reduced the number of out of sync/failed repository syncs from over a million to less than a few hundred.
 - Geo appears to be keeping up with the new data pushed to GitLab.com.
 - Customers appear to be using Geo more, helping us find additional issues.
- BAD
 - We have yet to do a thorough project-by-project verification of data mirrored from GitLab.com.
 - Our verification implementation only covers basic references, but does not check the integrity of the files themselves.
 - We still have a lot of obscenely slow database queries causing high load on the database.
 - We have not made much progress in putting hashed storage into production.
- TRY
 - Start using our repository checksum feature when 10.7 is deployed.
 - Improve verification to include object integrity.
 - Spending Q2 optimizing these database queries.
 - Assign someone to own the rollout of hashed storage.

Security Products

- GOOD

- Whole (new) Team onboarded with success
- Ability to release since the first milestone
- Openshift to GCP migration is going well
- Lot of expectations for security features

- BAD

- Each change in the jobs definition means updating docs everywhere, our .gitlab-ci.yml, and possibly introducing break changes. This process is long and error prone.
- Dependence on other departments, especially Frontend, for implementation on some issues.
- Lack of automated E2E tests/QA so long and painful testing for now
- We hit the limitations of our own features (using subgroups, .gitlab-ci.yml include, unprotected container registry, etc.).
- Lot of processes to assimilate, as the whole team is new
- Small usage of Security Products so few feedback

- TRY

- Improve our tools for security advisories triage.
- Improve usage of our tools internally
- Improve accessibility to our tools (includes in gitlab-ci.yml)

SECTION: company/okrs/2018-q2.md

<p class="h3">CEO: Grow Incremental ACV according to plan. 120% of plan, pipeline 3x minus in quarter, 100% at 70% of quota.</p>

- CMO: Build 3x minus in quarter pipeline for Q3. % of plan achieved.

- MSD: Generate sufficient demand to support our IACV targets. % of opportunity value creation target achieved.

- SDR: Support efficient inbound demand creation. Achieve 110% of SAO plan.

- Content: Publish content on the marketing site to accelerate inbound demand. Publish v2 of /customers. Publish /devops.

- Content: Execute DevOps integrated campaign to support SDR and Field Marketing demand generation. Produce 2 webinars with 500 registrants. Distribute Gary Gruver's book to 600 people.

- Field Marketing: Develop account based marketing strategies to deploy in support of Regional Director territory plans. Generate 41% of opportunity creation target worth of referral sourced opportunities.

- Field Marketing: Execute on field event plan, pre, during, and post event. Generate 12% of opportunity creation target worth of opportunity sourced through field events.

- Marketing Ops: Improve campaign tracking. Track UTM parameter values in salesforce.com for closed loop reporting in salesforce.com.

- Marketing Ops: Improve trial experience and trial engagement. Launch new email nurture series educating trial requesters on EEU. Increase trial to opportunity conversion rate by 20%.

- Online Growth: Extend SEO/PPC/Digital Advertising programs. Generate 31% of opportunity creation target worth of opportunity originating from the marketing site. Increase the amount

of traffic to about.gitlab.com by 10% compared to last quarter.

- Online Growth: Evaluate and build out ROIDNA CRO project. Increase GitLab EEU trial sign-ups by 15%. Increase GitLab EE downloads by 15%.
- SCA: Support self serve SMB business. Achieve 130% of SMB IACV plan.
- SDR: Generate outbound opportunity value. Source 16% of opportunity creation target worth of opportunity through outbound prospecting.
- PMM: Complete messaging roll-out and activation to include: Sales, Partner and Marketing enablement, tier plans specific messaging and positioning, demo aligned to new positioning and messaging, presenting new messaging at key conferences.
- PMM: Optimize trial sign-up, trial enablement and trial period experience, including the addition of GitLab.com trial and enhance trial nurture program.
- PMM: Submit strong submission for Gartner Application Release Orchestration (ARO) MQ and contribute to SCM Market Guide update and continue briefing sweep with all key Gartner and Forrester analysts.
- Outreach: Raise awareness. Double active evangelists. Launch education program. Double number of likes/upvotes/replies.
- Outreach: Keep being an open source project. Increase active committers by 50%
- Outreach: Get open source projects to use GitLab. Convert 3 large projects to self-managed GitLab.
- CMO: Enough opportunities for strategic account leaders. Make the Q2 SCLAU forecast.
- MSD: Achieve SCLAU volume target. Inbound SCLAU generation and outbound SCLAU generation.
- SDR: Achieve SDR SCLAU volume targets. % of revised Q2 SDR targets.
- Field Marketing: Achieve Field Marketing SCLAU volume targets. % of revised Q2 Field Marketing targets.
- SDR: Achieve SDR SCLAU volume targets. % of revised Q2 SDR targets.
- CRO: 120% of plan achieved.
- CRO: Success Plans for all eligible customers.
- Customer Success: Enabling a transition to Transformational Selling
 - Solutions Architects: Each Solutions Architect record video's of top 5 specialized use cases (including pitching services), reviewed by Customer Success leadership team.
 - Customer Success Managers: Do a quarterly business review for all eligible customers
 - Professional Services Engineering: 75% of Big and Jumbo opportunities include Professional Services line item
- Customer Success: 80% of opportunities advanced to stage 4 (Proposal) from stage 3 (Technical Evaluation) stage based on guided POC's.
 - Solutions Architects: 100% of Solutions Architect team members participate in at least 1 guided POC.
 - Customer Success Managers: 100% of TAM team members participate in at least 1 guided POC.
 - Professional Services Engineering: Create top 3 integration demonstration / test systems (LDAP, Jenkins, JIRA).
- CRO: Effective sales organization. 70% of salespeople are at 100% of quota.
 - Dir Channel: Increase Channel ASP by 50%
 - Dir Channel: Triple number of resellers above "Authorized Level"
 - Dir Channel: Implement VAR program (SHI, Insight, SoftwareOne, etc)
 - Sales Ops: Complete MEDDPIC sales methodology training. Account Executives and Account Managers should be proficient in capturing all MEDDPIC data points.
 - Sales Ops: Collaborate with Regional Directors to improve our conversion process in the earlier stages, more specifically between 1-Discovery and 2-Scoping as this is historically our lowest conversion.
 - Sales Ops: Complete 1:1 relationship between Accounts, Billing Accounts, and Subscription,

where applicable. This will ensure a much cleaner CRM.

- CFO: Compliant operations. 3 projects completed.
 - Legal: GDPR policy fully implemented.
 - Legal: Contract management system for non-sales related contracts.
 - Billing Specialist: Add cash collection, application and compensation to job responsibilities.
- VPE
 - Director of Support
 - Support Engineering: 100% SLA achievement for premium self-managed customers => 81%
 - Support Engineering: Document and implement severity-based ticket processing workflow for self-managed customers => 90%
 - Support Services: 100% SLA achievement for GitLab.com customers => 94%
 - Support Services: Develop and document Support Services workflows, processes, and automation needed to deliver world-class customer support => 90%

<p class="h3">CEO: Popular next generation product. Ship first iteration of the complete DevOps lifecycle, GitLab.com uptime, zero click cluster demo.</p>

- VP Product
 - Product: Ship first iteration of GitLab for the complete DevOps lifecycle.
 - Product: Create a dashboard of usage of features. Replace Redash with Looker.
 - Product: Identify causes of free and paid churn on GitLab.com.
- CFO: Make progress on having public clouds run us. 2 running everything.
 - Dir. Partnerships: Sign agreement to migrate target OS project
 - Dir. Partnerships: Strategic cloud partner chooses GitLab SCM for an offering
 - Dir. Partnerships: Successfully track and present data on the usage touch points for attribution tracking of our cloud agreement
- CTO: Make sure cloud native installation, PaaS and cluster work well. Zero clicks.
- CTO: Make sure we use our own features. Monitoring, CE review app, Auto DevOps for version and license.
- CTO: Jupyter integrated into GitLab. Hub deploy to cluster and Lab works with GitLab.
- VPE: Make GitLab.com ready for mission critical customer workloads (99.95% availability) => Rebuilding the team went well. Availability was marred by several incidents, particularly with the database. The GCP project was delayed several times, but now appears to be on a trajectory to complete.
 - Eng Fellow: Improve monitoring by shipping 5 alerts that catch critical GitLab problems
 - UX: Deliver three UX Ready experience improvements per release towards reducing the installation time of DevOps. => 100%
 - UX: Deliver three UX Ready experience improvements per release towards onboarding and authentication on gitlab.com.. => 66%
 - Quality: Deliver the first iteration of engineering dashboard charts and metrics. => 100% done, dashboard is up and running.
 - Quality: Complete the organization of files, directories and LoC into /ee/ directory. = 70% done, remaining work scoped with issues created. Javascript and LoC are the most challenging areas.
 - Security: Automated enforcement of GCP Security Guidelines => 90%, full completion dependent on post GCP migration
 - Security: Design, document, and implement security release process and craft epic with S1 & S2 issues and present to product for prioritization => 100%, security release process
 - Frontend: Deliver 100% of committed issues per release (10.8: 30/38 deliverables, 4/12

stretch; 11.0: 32/39 deliverables, 1/12 stretch; 11.1: 37/47 deliverables, 10/20 stretch)

- Frontend: Integrate the first 3 reusable Vue components based on design.gitlab.com
- Dev Backend: Define KPIs and build monitoring for release cycle performance
=> 90%. Prototype working but not shipped.
- Dev Backend: Create first iteration of engineering management training materials and merge into handbook => 100%
 - Platform: Deliver 100% of committed issues per release (overall: 41/55 (75%) deliverables, 7/39 stretch; 10.8: 15/21 deliverables, 1/14 stretch; 11.0: 12/17 deliverables, 3/13 stretch; 11.1: 14/17 deliverables, 3/12 stretch)
 - Platform: Ship first GraphQL endpoint to be used by an existing frontend component => 80%, endpoint is shipped, but some more advanced features still need to be added
 - Discussion: Deliver 100% of committed issues per release (overall: 32/39 deliverables, 19/30 stretch; 10.8: 9/10 deliverables, 6/6 stretch; 11.0: 12/14 deliverables, 7/11 stretch; 11.1: 11/15 deliverables, 6/13 stretch)
 - Discussion: Make GitLab a Rails 5 app by default => handful of issues remaining; working on plan for default to customers in 11.3
 - Distribution: Deliver 100% of committed issues per release (10.8: 16/16 deliverables, 1/5 stretch; 11.0: 9/9 deliverables, 1/1 stretch; 11.1: 13/13 deliverables, 2/4 stretch)
 - Distribution: Increase integration test coverage of HA setup => 100% done. End to end HA setup is run on every nightly build and on every release.
 - Geo: Deliver 100% of committed issues per release (10.8: 10/20 deliverables, 3/8 stretch; 11.0: 8/10 deliverables, 2/2 stretch; 11.1: 9/14 deliverables, 0/1 stretch)
 - Geo: Test and perform multi-node secondary failover on GitLab.com to GCP
 - Ops Backend: Design and implement a hiring pool process for Ops backend (possibly in collaboration with Dev Backend) => 100% done (first iteration). Great collaboration with Dev Backend to implement the new hiring pool process.
 - Ops Backend: Goal 2
 - CI/CD: Deliver 100% of committed issues per release (10.8: 27/38 deliverables, 3/10 stretch; 11.0: 39/46 deliverables, 14/25 stretch; 11.1: 9/16 deliverables, 2/6 stretch) => 75% for deliverables, 46% for stretch
 - CI/CD: Cover demo of Auto DevOps with GitLab QA => 100%
 - Monitoring: Deliver 100% of committed issues per release (10.8: 7/16 deliverables, 0/5 stretch; 11.0: 9/15 deliverables, 0/5 stretch; 11.1: 10/15 deliverables, 0/5 stretch) => (57%)
 - Monitoring: Publish official Grafana dashboards (50% complete, first iteration merged)
 - Security Products: Gemnasium infrastructure moved to GitLab => 100%, Gemnasium has been shutdown on May 15th, and everything required for Dependency Scanning migrated to GKE.
 - Infrastructure
 - Production: Move to GCP in April - 0% done - now targeting end of July.
 - Database: Improve application performance: 45% done
 - Database: Improve monitoring, configuration, and knowledge of our infrastructure: 57% done
 - Database: Improve team structure and workflow: 100% done
 - Gitaly: Ship v1.0 and turn off NFS => 80%. We got a lot closer to shipping 1.0 but still haven't delivered.
 - Gitaly: Get to v1.1 remove rugged code => 0%. Didn't ship 1.0 which is a prerequisite.

<p class="h3">CEO: Great team. Active recruiting for all vacancies, number of diverse per vacancy, real-time dashboard.</p>

- CCO: Active recruiting. 100% of vacancies have outbound sourcing.

- CCO: Increase double diverse candidates (underrepresented and low rent index). At least one qualified diverse candidate interviewed for each vacancy.
- CCO: Increase leadership aptitude and effectiveness for the executive team. At least one training per month, one leadership book per quarter, and improvement in 360 feedback.
- CFO: Real-time dashboard for everything in the Metrics sheet. 100% of metrics.
 - Legal: Scalable solution for hiring added in at least 5 countries.
 - Controller: Close cycle reduced to 9 days.
 - Controller: Audit fieldwork completed with no material weaknesses reported.
- VPE: Refactor engineering handbook to reflect org structure and have leaders take ownership of their sections => 100% done
- VPE: Source 150 candidates and hire a director of infra, director of support, and a prod manager: Sourced 150 (100%), Hired 3 (100%) => 100% complete on sourcing and hiring
 - Dev Backend: Source 50 candidates and hire a geo manager: Sourced 50 (100%), Hired 1 (100%)
 - Discussion: Source 150 candidates and hire 3 developers: Sourced 160 (100%), Hired 2 (66%)
 - Platform: Source 150 candidates and hire 3 developers: Sourced 160 (100%), Hired 1 (33%)
 - Distribution: Source 50 candidates and hire 1 engineer: Sourced 52 (110%), Hired 0 (0%)
 - Ops Backend: Source 50 candidates and hire 1 monitoring manager: Sourced 56 (112%), Hired 0 (0%)
 - Monitoring: Source 100 candidates and hire 2 monitoring engineers: Sourced 100 (100%), Hired 0 (0%)
 - CI/CD: Source 100 candidates and hire 2 engineers: Sourced 101 (101%), Hired 1 (50%) => 100% complete for sourcing, 50% complete for hiring
 - Security Products: Source 50 candidates and hire 1 Backend Developer: Sourced 50 (100%), Hired 0 (0%)
 - Quality: Source 100 candidates and hire 2 test automation Engineers: Sourced 128 (128%), Hired 2 (100%) => 100% done for both sourcing and hiring.
 - Frontend: Source 150 candidates and hire 3 developers: Sourced 10 - In progress (6%), Hired 3 (100%)
 - Infrastructure: Source 50 candidates and hire a database manager: Sourced 50 (100%), Hired 0 (0%)
 - Production: Source 200 candidates and hire 4 production engineers: Sourced 71 (35.5%), Hired 3 (75%)
 - Database: Source 100 candidates and hire 1 database engineers and 1 manager: Sourced 20 (20%), Hired 0 (0%)
 - Gitaly: Source 100 candidates and hire 2 Gitaly developers: Sourced 100 (100%), Hired 0 (0%)
 - UX: Source 50 candidates and hire a UX designer: Sourced 74 (148%), Hired 1 (100%)
 - Security: Source 150 candidates and hire an Anti-abuse Analyst, a SecOps Engineer, and a Compliance Analyst: Sourced 202 (135%), Hired 2 (66%)
 - Support Engineering: Source 210 candidates and hire 1 support engineering manager and 6 support engineers: Sourced X (X%), Hired X (X%)
 - Support Services: Source 90 candidates and hire 3: Sourced 20 (22%), Hired 3 (100%)
 - CMO: Hire to plan and prevent burnout. DevRel team plan, corporate marketing team plan, marketing and sales development team plan.
 - MSD: Hire to plan. SDR team plan, Field Marketing team plan, Online Growth team plan

Retrospective

VPE

- GOOD

- We rebuilt the Production team with a concerted recruiting effort
- The Engineering Handbook refactor went smoothly
- All sourcing goals were met
- All hires were made

- BAD

- Several high-profile DB incidents marred availability of GitLab.com and decreased customer confidence

- The GCP project was delayed several times in the quarter

- TRY

- We need to continue the better predictability that the GCP project finished the quarter with and close it out in July

- We need to continue adding to our production and database teams and implement the new org structure

- Directors and managers need to take ownership of their handbook sections in Q3 and build them out

- I need to assist directors with their manager hiring in Q3, as well as their trickiest IC vacancies

Frontend

- GOOD

- Made hiring target and onboarded successfully all new hires
- New Teams inside the Frontend department
- We shipped the Bootstrap 4 upgrade and the Merge Request Refactoring was finally finished
- Our done deliverables count is constantly going up

- BAD

- Hard time with sourcing for roles outside of Frontend

- Bootstrap Upgrade had too many regressions

- Too many bumpy development flows (too long until actionable, blocking dependencies, etc.) and late realisation of problems

- TRY

- Continue Hiring and Team structure transformation

- Getting better to estimate and especially find stepping stones early

- Improve workflows, tooling and especially individual planning to get to 100% deliverables

Dev Backend

- GOOD

- Two KRs at 100%: Sourcing/hiring + handbook

- Hire was made quickly from pre-existing applicants, so sourcing was applied to future hires

- Handbook updates spread through quarter, healthy pace for introducing + discussing change

- BAD

- Sourced candidates haven't been contacted - need better pipeline for sourced talent

- Handbook KR wasn't specific enough, had to redefine that halfway through the quarter

- Dashboards didn't ship - too much time waiting on external teams

- TRY
 - Keep KRs from being dependent on other teams as much as possible
 - Ensure KRs are specific and measurable
 - Both of the above are known best practices for KRs. Don't make exceptions to known best practices for KRs. :)

Discussion

- GOOD
 - Made two new hires early in the quarter, putting us ahead of schedule for a while
 - Shipped deliverables at a consistent rate
 - Hiring pool puts us in better shape to hire well across all teams
- BAD
 - Missed hiring target; we also aren't particularly close to making that extra hire soon
 - Missed a particular deliverable (batch commenting) several times
 - Rails 5 spilled over to Q3, but it is much closer now
- TRY
 - Using weight / throughput to keep feature delivery on track
 - Rotate team expertise more
 - Work closer with the frontend team in scheduling

Distribution

- GOOD
 - Being very disciplined in scheduling deliverables allowed us to keep our promises.
 - Managed to deliver Helm charts in beta as promised by working in weekly milestones which allowed us to change direction quicker based on current status and direction.
 - Introduction of Team Issue Triaging allowed us to keep on top of incoming issues with the omnibus-gitlab issue tracker, and reduce the number of stale issues.
 - Replaced a team member fairly quickly after a departure.
- BAD
 - Team size has reduced which impacted our ability to deliver on Technical Debt and performance improvements.
 - Hiring was impacted by a mismatch in our proposed compensation and real market expectations.
 - Noticeable team fragmentation between two major team projects.
 - No capacity to tackle non-critical projects.
- TRY
 - Reduce team fragmentation by rotating team between projects.
 - Create a stronger candidate pipeline and hit the hiring targets.

Geo

- GOOD
 - We conducted more than 8 GCP failover rehearsals and improved them each time.
 - We shipped a repository ref checksum features that gave us confidence in the GCP data for 4+ million repositories.
 - We helped improve Geo at scale by fixing numerous bugs with uploads, Wiki, and repository sync.
 - We upgraded GitLab to git 2.16, which turned out to be non-trivial.

- We shipped HTTP push to the Geo secondary, including Git LFS support.
- We made significant progress towards supporting SSH push to the Geo secondary.
- We made progress towards activating hashed storage in production by finding and fixing more bugs in the implementation.
- BAD
 - We missed a number of deliverables due to merge requests in review.
 - We overestimated team capacity due to GCP migration tasks and vacations.
 - We still have database performance issues at scale.
 - We still haven't activated hashed storage in production.
- TRY
 - Nominate another Geo maintainer
 - Reduce the variability of the deliverables scheduled from month to month
 - Activate hashed storage in dev and Ops instances today

Platform

- GOOD
 - Consistent deliverable hit rate
 - Finally shipped GraphQL endpoint, which had been an OKR at least once before!
 - Hit sourcing goal
 - Having Deliverable and Stretch issues works well; few Stretch issues get hit, but developers indicate that they feel less pressure as the feature freeze nears than before
- BAD
 - Multiple deliverables were affected by urgent work related to the GDPR
 - Multiple deliverables slipped because issue scope wasn't well defined until late into the month, and was often larger than anticipated
 - Only hired 1 person
 - Deliverable hit rate still under 80%
- TRY
 - Being more conservative with maximum weight per person
 - Work with PMs to ensure that issue scope is defined ahead of the kickoff
 - Keep iterating on hiring process

Gitaly

- GOOD
 - Got on strategy for identifying remaining work to 1.0 (tripswitch)
 - Began working with agency for sourcing hires (Sourcery)
- BAD
 - 1.0 didn't have a fully identified scope until beginning of Q3
 - 1.1 still hasn't become a priority until 1.0 is delivered
 - Lots of churn around who is on the team made consistent throughput difficult
 - Extended use of feature flags made it easy to create complications (easier to turn off a feature flag than fix a bug)
 - Hard to attract the right kind of candidate (too many applicants who know Rails but only dabble in Golang)
- TRY
 - Working more closely with recruiting agency to get the right kind of hires
 - Keeping team size more stable + above a minimal threshold for forward progress

- Being less conservative with feature flags and a little more willing to trade risk for time-to-delivery

Database

- GOOD
 - Set up of team structure for future team members.
- BAD
 - Self inflicted downtime from maintenance in June
 - Not enough people (2) to pay attention to production stability and work with Engineering teams on performance
 - Small pipeline of candidates for DB roles
- TRY
 - Implement and follow plans for change control around any DB work
 - Initial team structure for Site Availability / Site Reliability including DB
 - Pulled in sourcing agency
 - Updated posts to Ruby Weekly and hackernews

Production

- GOOD
 - Hiring - help from all involved from recruiting to exec to team was great
 - Started to get a handle on infrastructure work for GCP and burnt down work to do
- BAD
 - Team has been spread thin - only 2 people on call in EU, 4 in Americas regions is hard on productivity
 - GCP dates slipping
- TRY
 - Continued strict focus on getting GCP done with focus on Production stability, GCP, everything else
 - Getting new people in Q3 up to speed and on call in fast, but reasonable time
 - Focus on hiring in EU regions
 - Team structure changes mentioned in database

Ops Backend

- GOOD
 - Great collaboration with Dev Backend to implement a new hiring process to pool candidates for backend dev roles.
 - Managers across backend teams working and supporting each other through the changes in hiring process.
- BAD
 - Got through the entire hiring process with a great manager candidate and was not able to close them at the offer stage due to a mismatch in compensation expectation.
- TRY
 - Make sure compensation expectation are clear with all candidates during the screening call.
 - Continue to iterate and enhance our pool hiring process.
 - Build a strong pipeline of candidates so that we are choosing the best from multiple good candidates and have a fallback if we loose our first choice

CI/CD

- GOOD
 - Completed coverage of Auto DevOps with GitLab QA
 - A lot of candidates were sourced
- BAD
 - 75% deliverable completion rate falls quite short of the 100% goal
 - Issues mentioned at kickoff were some of those that didn't get merged
 - Configuration Team splitting off reduced capacity
 - Only new developer hire occurred at very end of quarter
 - Team experienced a lot of transition with new manager and change in PM
- TRY
 - Using weight or throughput to assess delivery impact and team capacity
 - Have new manager focus on hiring for the team especially at the start of the quarter

Monitoring

- GOOD
 - Great backend work by temporary team member.
 - Delivered features despite being short staffed.
- BAD
 - Short staffed due losing a team member for 1/3 of the quarter.
- TRY
 - Continue to source and hire more onto the team.
 - Size workload better to account for being short staffed.

Security Products

- GOOD
 - Onboarding is done, the team is working at full speed now.
 - We can ship features with backend in GitLab.
 - Gemnasium migration is done, the team can focus on GitLab issues.
 - We have a release process for Security Products docker images.
- BAD
 - The team should be growing to handle all the domain of Security Products. Even if we sourced 50 people, we didn't manage to hire anyone in this quarter.
 - Some planning issues, due to our lack of knowledge of some processes.
 - The product vision was not aligned with our OKRs, so we had to update them during the quarter to remove some expectations about Gemnasium integration into Omnibus.
 - Not enough time/resources to maintain legacy code and wrappers.
- TRY
 - Improve planning with a Gantt chart.
 - Commit to 100% deliverables shipped to production.
 - Better integration with GitLab QA.
 - Release Manager rotation to handle bugs, tools update, support, etc.

Security

- GOOD
 - We continue to mitigate new security vulnerabilities at a timeframe that is at or better

than industry standard.

- Our response time to GitLab.com abuse cases has significantly improved through detection automation efforts.

- Our hiring rate is has been fairly healthy, and sourcing efforts have been successful.

- BAD

- Logging capabilities are still lacking, such that incident response impact analysis is onerous.

- Lack of consistent severity and priority labeling on backlogged security issues poses challenge in prioritization.

- Security roles are difficult to hire for, due to high demand for skilled candidates. Our security compensation benchmark needs to be more competitive to attract top talent.

- TRY

- Continue to refine and improve upon critical and non-critical security release processes.

This will involve continuing to train new RMs to become familiar with the process.

- Increase security hiring pipelines and close out more hires than past quarters, in order to scale Security Team with company growth and initiatives.

Support

- GOOD

- Focus on SLA achievement with training, process and tool enhancements helped global team reach 88% overall.

- Functionality to track and report on Customer Satisfaction restored.

- Very good achievement to hiring plan.

- BAD

- Still too many SLA breaches while we grow the team.

- Closing Support Engineering manager positions needs to happen faster.

- TRY

- Source-a-thon for key positions, with less focus on Support Agents and directed regional focus on Support Engineers.

- Determine ways to streamline technical onboarding.

Support Engineering

- GOOD

- More Support Engineers are exposed to High Availability Configurations

- Ticket Growth for Self-managed customers is growing slower than revenue.

- BAD

- We need to grow AMER West & APAC to achieve SLA targets

- Learning GEO is difficult & upgrading GEO needs clearer documentation.

- TRY

- Targeted APAC recruiting

- Designing a GEO Bootcamp curriculum

- Finalize Premium ticket Priority to offer better customer experience.

Services Support

- GOOD

- With better staffing we've been able to consistently increase our SLA performance and work through a sizeable backlog.

- Services Agents have done an great job collaborating on process and documentation.
- BAD
 - This quarters hires are starting later in the quarter than we would have liked.
 - We haven't been able to close any EMEA hires.
- TRY
 - Get a first iteration on our Statement of Support finalized.
 - Focus on EMEA hiring in source-a-thons and recruiting.
 - Transition GitLab.com free users out of ZenDesk.

Quality

- GOOD
 - Unblocking ourselves after Looker ETL delays for building quality metrics dashboard. We completed the prototype and it is running at: <https://quality-dashboard.gitlap.com>
 - Everyone in the team has clear ownership and priorities.
 - We made good progress with hiring and sourcing.
- BAD
 - We discovered a lot of un-triaged CE & EE bugs as part of the dashboard prototype implementation.
 - ETL for GitLab.com Looker was delayed. We were blocked for multiple weeks.
 - Lack of test coverage in gitlab-qa and in the release process.
 - The team is stretched thin, especially with issue and merge request triage. Quality team rotation hasn't been enough help, a lot of this still falls on Mark F.
- TRY
 - We need to plan very early to get help from other teams on cross-functional initiatives (esp with CE/EE code reorg). Issues should be prepped and communicate at least one milestone ahead and communicate again before the start of the milestone.
 - Implement issue triage assignments for the rest of engineering and not just for the quality team.
 - For important deliverables and initiatives, we should lean on tools that are more in our sphere of control.
 - Bring up more gitlab-qa test automation coverage.

UX

- GOOD
 - Research and design work done for Auto DevOps in Q1 set us up for success in delivering UX Ready solutions.
 - Increased engagement and collaboration between PM and UXers.
 - Sourcing and hiring went smoothly with many good candidates.
- BAD
 - Hiring and increasing workloads slowed down progress on the design system.
 - Scheduling became time-consuming as we iterated on the process and PM/UXer/FE handoff.
- TRY
 - Continue to iterate on scheduling and planning process.
 - Focus work in design system on areas that support GitLab vision and increase usability.

Pipe-to-Spend

- GOOD

- 148% of opportunity value creation target achieved.
- 185% of SMB / Self Serve IACV plan achieved.
- Improved visibility of inbound demand with the introduction of Bizible, and campaign performance with the new campaign dashboard.
- Content team hit 100% of their KRs and content (especially video content) has improved.
- BAD
 - 82% of revised Q2 Field Marketing SCLAU forecast.
 - Hiring plan not met by 1 person each in field marketing and online growth.
 - Over committing and under delivering on field events. Communication, collaboration, and organization are not consistently good.
 - Hard to work with other teams that do not work asynchronously. Too many meetings being held with no outcome.
- TRY
 - Standardize and document process for evaluating whether or not we should sponsor an event with clear expectations in terms of SCLAU and ROI.
 - Respectfully push back when last minute requests are made that won't move the needle.
 - Share customer feedback and pain points with product management on the CustomersDot to ensure it supports a more self-serve experience involving upgrades, true-ups and renewals.
 - Put more time into cross functional coordination and kickoffs to ensure PMM, GM, Sales et al are working tightly together. Hold each other accountable to GitLab's async workflow and MVCs.

SECTION: company/okrs/2018-q3.md

CEO: Grow Incremental ACV according to plan. IACV at 120% of plan, pipeline for Q4 at 3x IACV minus in quarter orders, LTV/CAC per campaign and type of customer

- VPE
 - Support: Achieved 94.5% CSAT across all customer tickets for Q3.
 - Self-managed: 95% on CSAT, 95% on Premium SLAs: Achieved 95% CSAT and 83% against Premium SLAs.
 - Services: 95% on CSAT, 95% on Premium SLAs: Achieved 93% CSAT and 94% against SLAs.
- CMO: Achieve 3x IACV in Q4 pipeline minus in quarter orders
 - Content: Ensure the content team selects their own work and focuses on results. No distractions.
 - Content: Increase sessions on content team blog posts. 5% month over month.
 - Content: Measure and increase pipe-to-spend for content team activities. 10% MoM.
 - Field Marketing: Improve account based marketing for large & strategic accounts. Pull in 1 large or strategic deal into Q3, increase opportunity size of 2 large or strategic deals, 5 intros to new departments at large or strategic accounts.
 - Field Marketing: Increase operational maturity in field marketing tracking and execution. All event lead uploads within 48 hours, all contacts accurate statuses and notes, accurate campaign data for all field marketing campaigns tracked in salesforce.com.
 - Field Marketing: Achieve 100% of field marketing portion of SCLAU plan.
 - Online Growth: Expand online growth tactics. Increase overall traffic to existing pages by 10% compared to last quarter, increase sign-ups from SEO/PPC/Paid Social by 20% compared to last quarter .
 - Online Growth: Improve about.gitlab.com conversion rate optimization. Increase live chat

leads 20%, increase contact requests by 20%, increase trial sign-ups by 20%.

- Marketing Program Management: Launch new email nurture series educating trial requesters on .com Premium plan. Keep unsubscribe rate below 1%, 30% of nurture audience at "engaged" progression status or higher.

- Marketing Program Management: Increase awareness and ongoing education on GitLab <> Google Partnership. Increase GKE trials referred by GitLab/week by 3X.

- Marketing Program Management: Improve reporting for marketing programs. Automate and schedule reporting for email & webcast performance, ensure all email and webcast programs are tracked completely in salesforce.com campaigns.

- Marketing Operations: Streamline lead management processes. Refreshed lead & contact layouts with all unnecessary fields removed from view, trim down to a single lead queue view for SCA team.

- Marketing Operations: Deploy multi-touch attribution model in Bizible.

- Marketing Operations: Ensure all online marketing is tracked as campaigns in salesforce.com. Complete tracking of all required campaign fields for all online marketing.

- SMB Customer Advocacy: Achieve 200% of SMB IACV plan.

- SMB Customer Advocacy: Improve SMB account management. Increase SMB gross retention to 90%, increase net retention to 150%, reduce number of manual license key replacements by 30%.

- CMO: Committer Program

- Increase the number of contributions (not contributors) from the wider community. For the 11.3 release, the target MR is 120 & for the 11.4 release the target MR is 150.

- Hired full-time GitLab contributor(s) at customers. One hire made at the customer and a blog post about their initiatives published.

- Implement at least 10 improvement ideas to streamline the contribution process for the wider community: e.g. Improve on-boarding experience

- CRO

- Dir, Customer Success:

- Each SA/TAM team successfully proposes & creates at least one SOW to increase service pipeline. As a result, services bookings increase by 100%.

- Develop an approach to support growth in strategic accounts. Successfully execute program against one Strategic account per region.

- Leverage Customer Success team growth to increase opportunities at the highest potential Strategic growth accounts. Achieve 300% of the Q3 growth iACV plan.

<p class="h3">CEO: Popular next generation product. GA for the complete DevOps lifecycle, GitLab.com ready for mission critical applications, graph of DevOps score vs. cycle time.</p>

- VPE: Make GitLab.com ready for mission-critical customer workloads - 70% (moved to GCP and hired great team, not up to new standards though, lots more to do)

- Frontend: Preserve 100% of error budget: 100%

- Frontend: Implement 10 performance improvements: X/10 (X%)

- Frontend Discussion: Preserve 100% of error budget: 100%

- Frontend Discussion: Implement 5 performance improvements on the MR/issue page X/10 (X%)

- Frontend MD&P: Preserve 100% of error budget: 100%

- Frontend MD&P: Implement and integrate 10 reusable Vue components into GitLab X/10 (X%)

- Dev Backend

- Plan: Preserve 100% of error budget: 94% (S3 incident)

- Plan: Implement 10 performance improvements: 8/10 (80%)

- Distribution: Preserve 100% of error budget: 100%

- Distribution: GitLab Helm charts generally available: 100%

- Release Management: Complete feature flag work necessary for weekly releases: 50%
- Geo: Preserve 100% of error budget: 94%
- Geo: Finish failover to Google Cloud July 28 : Completed mid-August
- Geo: Implement 5 performance improvements (P1/P2/P3 categories): 6/5 (100%)
- Gitaly: Preserve 100% of error budget: 100%
- Gitaly: Ship v1.0 and turn off NFS (100%)
- Manage/Create: Implement 10 performance improvements: 6/10 (60%)
- Gitter: Preserve 100% of error budget: 100%
 - No gitter.im downtime
 - Gitter: Open source Android and iOS applications 100%
 - <https://gitlab.com/gitlab-org/gitter/gitter-android-app>
 - <https://gitlab.com/gitlab-org/gitter/gitter-ios-app>
 - Gitter: Deprecate Gitter Topics 100%
 - <https://gitlab.com/gitlab-org/gitter/webapp/issues/1947>
 - Manage: Preserve 100% of error budget: 97%
 - Create: Preserve 100% of error budget: 38%
- Ops Backend
 - CI/CD: Preserve 100% of error budget: 100%
 - CI/CD: Implement one key architectural performance improvement from <https://gitlab.com/gitlab-org/gitlab-ce/issues/46499>: 0% (Reducing the per job footprint for the cibuild table is code complete but not merged, merging is pending upgrading to Rails 5)
 - Configuration: Preserve 100% of error budget: 100%
 - Configuration: Fully document and automate Auto DevOps local setup (359): 100%
 - Monitoring: Preserve 100% of error budget: 94%
 - Monitoring: Implement admin performance dashboard. (Design issue): 30% (design is nearly complete, engineering has not started)
 - Secure: Preserve 100% of error budget: 85% (1 S2 incident)
 - Secure: Aggregate and store vulnerabilities occurrences into database: 85% (Only SAST reports implemented) (&251)
- Infrastructure: Move to GCP July 28th - GCP migration completed Aug 11, 2018. (100%)
 - Database: Preserve 100% of error budget: 91%
 - Database: all issues in the Q3 infrastructure epic
 - Database: all issues in the Q3 application performance epic
 - Production: Preserve 100% of error budget: -17%
- Quality
 - Implement Review Apps for CE/EE with gitlab-qa test automation validation as part of every Merge Request CI pipeline: 50%, review apps for EE completed CE ongoing.
 - Triage and add proper priority and severity labels to 80% CE/EE bugs with no priority and severity labels: 98.5%, above target for EE, came under by 1.5% for CE. Triage package implemented to maintain triage efforts.
- UX
 - Establish the User Experience direction for the security dashboard: Aid in completing a Competitive analysis, identify 10 must have items for the security dashboard, complete a design artifact/discovery issue: 100%
 - Identify and document the styles for the first 10 components being developed by the FE team: 90%
- UX Research
 - Incorporate personas into our design process for 100% of our product features: 100%
 - Identify 5 pain points for users who have left GitLab.com. Work with Product Managers

to identify solutions: 90%

- Security
 - Identify and push top 10 sources/attributes to S3 instance and ensure at least 90 day retention and tooling for security investigations: 100%
 - Triage 50 backlogged security labeled issues and add appropriate severity and priority labels: 102%, triaged both CE and Infra repos. Including link to CE S2 triaged issues only as example.
- CMO: Increase brand awareness and preference for GitLab.
 - Corporate marketing: Help our customers evangelize GitLab. 3 customer or user talk submissions accepted for DevOps related events.
 - Corporate marketing: Drive brand consistency across all events. Company-level messaging and positioning incorporated into pre-event training, company-level messaging and positioning reflected in all event collateral and signage.
 - Corporate marketing: Increase share of voice. 20% lift in web and twitter traffic during event activity.
 - Product marketing: Increase inbound leads - Create 20 new web pages to educate market and prospects about GitLab capabilities and solutions
 - Product marketing: Deliver 18 enablement sessions to sales and channel teams to increase SCLAU by count of 15
 - Product marketing: Launch Customer Advisory Board with 15 key strategic GitLab account customers to create 15 customer champions (references) to help close SCLAU opportunities
 - Alliances: Get listed and offered as partner of choice on large cloud providers. 3 public clouds.
 - Alliances: Develop an opportunity for migration with a large OSS community. Sign letter of intent.
 - Alliances: Secure keynotes at a big cloud conferences for brand building and sales momentum. 2 keynotes.
- Product
 - Hire two directors. 0/2
 - DevOps score vs. cycle time first two iterations shipped. Prove relationship between DevOps score and releases per year. 0/2
 - Hire a growth team. PM hired.
 - Make 10 key feature docs more enticing, replacing need for their about.gitlab feature pages 5/10 (50%)

<p class="h3">CEO: Great team. ELO score per interviewer, Real-time dashboard for all Key Results.</p>

- VPE: 10 iterations to engineering function handbook: 7.5/10 (75%)
 - Infrastructure: 10 iterations to infrastructure department handbook: 10/10 (100%)
 - Production: 10 iterations to production team handbook: X/10 (X%)
 - Ops Backend: 10 iterations to ops backend department handbook: 4/10 (40%)
 - Ops Backend: Define and launch a dashboard with 2 engineering metrics for backend teams => 0%, Throughput and cycle time are the 2 metrics we would like to track. Implementation of the dashboard was not started in Q3.
 - Quality: 10 iterations to quality department handbook: 8.5/11 (77%)
 - Security: 10 iterations to security department handbook: X/10 (X%)
 - Support: 20 iterations to support department handbook: 21/20 (105%)
 - Self-managed: 10 iterations to self-managed team handbook focused on process efficiency: 10/10 (110%)

- Services: 10 iterations to services team handbook focused on process efficiency: 11/10 (110%)
- Support: Implement dashboard for key support metrics (SLA, CSAT)
- VPE: Source 50 candidates for various roles: 50/50 sourced (100%) confidential spreadsheet
 - Frontend: Source 100 candidates by Aug 15 and hire 2 manager and 3 engineers: X sourced (X%), hired X (X%)
 - Frontend Discussion: Source 25 candidates by July 15 and hire 1 engineer: X sourced (X%), hired X (X%)
 - Frontend MD&P: Source 50 candidates by Aug 15 and hire 2 engineers: X sourced (X%), hired X (X%)
 - Dev Backend: Create and apply informative template for team handbook pages across department (70%)
 - Dev Backend: Create well-defined hiring process for ICs and managers documented in handbook, ATS, and GitLab projects (70%)
 - Dev Backend: Source 20 candidates by July 15 and hire 1 Gitaly manager: 20 sourced (100%), hired 1 (50%)
 - Plan: Source 25 candidates by July 15 and hire 1 developer: 50 sourced (100%), hired 0 (0%)
 - Distribution: Source 30 candidates by Aug 15 and hire 1 packaging developer and 1 distribution developer: 30 sourced (100%), hired 0 (0%)
 - Manage: Source 35 candidates by Aug 15 and hire 2: 35 sourced (100%), hired 0 (0%)
 - Create: Source 25 candidates by July 15 and hire 1: 25 sourced (100%), hired 0 (0%)
 - Infrastructure: Source 20 candidates by July 15 and hire 1 SRE manager: X sourced (X%), hired X (X%)
 - Database: Source 50 candidates by July 15 and hire 2 DBEs: 7 sourced (14%), hired 1 (50%)
 - Production: Source 75 candidates by July 15 and hire 3 SREs: 24 sourced (32%), hired 2 (66%)
 - Ops Backend: Source 30 candidates by July 15 and hire monitoring and release managers: 30 sourced (100%), hired 1 (50%) => Hired an engineering manager for the Monitor team.
 - CI/CD: Source 60 candidates by July 15 and hire 2 developers: 15 sourced (25%), hired 0 (0%)
 - Configuration: Source 90 candidates by Aug 15 and hire 3 developers: 90 sourced (100%), hired 0 (0%)
 - Monitoring: Source 90 candidates by Aug 15 and hire 3 developers: 137\ sourced (100%), hired 2 (67%) (We don't have reliable numbers for "sourced" because it was a pooled approach)
 - Secure: Source 75 candidates by Aug 15 and hire 3 developer: ~50 sourced (66%), hired 0 (0%)
 - Serverless: Source 20 candidates by Aug 15 and hire 1 developer: 0 sourced (0%), hired 0 (0%)
 - Quality: Source 150 candidates by Aug 15 and hire 3 test automation engineers: X sourced (60%), hired 2 (78%)
 - Security: Source 150 candidates by Aug 15 and hire 5 security team members: 105 sourced (105%), hired 5 (100%)
 - Support: Source 50 candidates by July 15 and hire an APAC manager: 50 sourced (100%), hired 0 (0%) - pursued top candidate for over a month who ended up signing our offer days after Q3 ended!
 - self-managed: Source 350 candidates by July 30 and hire 7 support engineers: 110 sourced (32%), hired 7 (100%)
 - Services: Source 200 candidates by July 30 and hire 4 agents: 110 sourced (55%), hired 4 (100%)

- UX: Source 25 candidates by Aug 15 and hire 3 ux designers: 25 sourced (100%), hired 2 (66%)
- CFO: Improve payroll and payments to team members
 - Controller: Analysis and proposal on Trinet conversion including cost/benefit analysis of making the move (support from peopleops)
 - Controller: Transition expense reporting approval process to payroll and payments lead.
 - Controller: Full documentation of payroll process (sox compliant)
- CFO: Improve financial performance
 - Fin Ops: Marketing pipeline driven revenue model (need assistance from marketing team)
 - Fin Ops: Recruiting/ Hiring Model: redesign gitlab model so that at least 80% of our hiring can be driven by revenue.
 - Fin Ops: Customer support SLA metric on dashboard
- CFO: Build a scalable team
 - Legal: Contract management system for non-sales related contracts.
 - Legal: Implement a vendor management process
 - Data and Analytics: Real Time Dashboard for Company critical data. Product Event and User Data Dashboards implemented (signed off by Product Management), Customer Success Dashboard implemented (signed off by Dir. of Customer Success), Marketing Dashboard implemented (signed off by marketing team).
 - Data and Analytics: Increase adoption and usage of the data warehouse and dashboards. Self serve process for generating new events and dashboards documented, Data tests in place for all current and new data pipelines.
 - Data and Analytics: Improve security of corporate data. Every ELT pipeline validates permissions.
- CCO: Efficient and Effective Hiring.
 - New and Improved ATS chosen and implemented for more efficient and effective hiring (Key result is improved metrics, decreases time in process, minimizing manual efforts for resume review and scheduling)
 - More on-boarding guidance with sessions held for new hires on Monday and Tuesday and recorded for asynchronous value.
 - First iteration of ELO score for interviewers.
- CCO: Build a strong and scalable foundation within People Ops
 - Select Benefits, 401 (k), Stock options administration, and Payroll providers to bring Payroll and benefits in-house
 - Improve scalability and effectiveness of the 360 process and employee engagement survey process.
- CCO: Summit Success
 - Complete 2018 Summitt successfully, through a survey to attendees and non-attendees
 - Determine location, changes and improvements for the 2019 Summit

Retrospective

VPE

- Good
 - We moved to GCP successfully
 - Hiring the infra team went great
 - Handbook was substantially Improved
 - All departments (except development) are on hiring pace
 - Sourcing was done on time

- Error budgets incentivized GitLab.com availability without slowing the team down
- Bad
 - We moved to GCP later than anticipated
 - RepManager felt like a roll-of-the-dice during the migration. Should have been rock solid
 - Development teams are behind their needed hiring pace (Backend Rails roles)
 - Can't yet measure availability simply (one metric)
 - Pages outage during summit was self-inflicted
- Try
 - Work with PeopleOps/Finance to do something about Rails hiring
 - Rip out RepManager
 - Stick to new Infra roadmap (solves multiple high-priority issues)
 - Continue to steer culture of teams through deliberate promotions/hiring

Frontend

- Good
 - ...
- Bad
 - ...
- Try
 - ...

Dev Backend

- Good
 - Hired manager for Manage
 - Shipped some team pages and encouraged a lot of thought around how best to "market" teams both internally and externally
 - Hiring process for developers is very thoroughly documented
 - New consistent technical interview process is live and demonstrating great results
 - Team is highly engaged in improving hiring
- Bad
 - Still only on track to hit 35% of hiring goals by EOY
 - Documentation KRs got largely finished then moved to backburner after summit
 - Still a lack of clarity in the team about the new product categories and which teams are responsible for what aspects of the work, especially technical debt
- Try
 - Be willing to adjust KRs mid-quarter if priorities shift dramatically (like they did in the wake of our hiring analysis)
 - Set aggressive lag indicator targets for hiring to spur a sea change
 - Communicate more directly and frequently with hiring managers until our pace is more comfortable

Plan

- Good
 - Working with PM, FE, and UX, issues are much smaller and easier to schedule

- We got a 'free' team member from an internal transfer, who was ready to start working at a high level immediately.
- Bad
 - Still no hires: last hire was in May
 - Lost six points from error budget very early in the quarter; fixed processes to reduce the human error in that incident
 - Missed two performance improvements (one in review but not merged, one pushed to Q4)
 - Batch commenting was only merged just before the 11.4 freeze, having started work in January
- Try
 - Continue monitoring the due-22nd experiment
 - Directly reaching out to hiring prospects, rather than going via Recruiting
 - Make our backend developer posting more attractive
 - Make our backend developer posting more visible

Distribution

- Good
 - Released Charts in GA on time, received positive feedback
 - Prioritised important GitLab.com and customer issues in time
 - Managed to preserve the error budget
 - Sourcing was done on time
 - Encouraged discussion with the whole engineering team over feature flags
- Bad
 - Team morale dropped after releasing Charts as GA, exhaustion set in after months of pushing towards the big milestones
 - Other work suffered with the focus on Charts
 - Technical debt is on rise across projects
 - Hiring pipeline is of low quality
- Try
 - Identify the most critical technical debt items and address them
 - Create a better balance between the team owned projects
 - Restart the team trainings effort

Geo

- Good
 - Completed the GCP migration
 - 5m+ projects and millions of attachments/uploads migrated!
 - Coordination between teams to execute the migration
