

t systems. These services include consulting with the customer's technical staff about the best way to migrate not only the customer's source code but also their entire SDLC to the GitLab platform. We may implement the migration in a phased approach or a replacement approach depending on the customer's comfort level and desires around adoption.

This can include:

- Importing your projects from GitHub, Bitbucket, GitLab.com, FogBugz and SVN into GitLab
- Migrating from SVN: Convert a SVN repository to Git and GitLab

In all cases, a GitLab Adoption Plan will be created with the customer to outline the goals of the migration and adoption, as well as any plans that involve customer or GitLab Professional Services actions.

Integration Services

The GitLab Professional Services Engineering group will also work with a customer's technical team to come up with an Integration Plan for the GitLab implementation. Typically part of the overall Professional Service Plan, this Integration Plan will consider a customer's existing systems and corporate policies in regards to:

- Integration with LDAP/AD or other OAuth services for authentication
- Integration to Jira, Jenkins, Redmine, Mattermost
- Custom Integrations
 - Automation
 - API: Automate GitLab via a simple and powerful API.
 - GitLab Webhooks: Let GitLab notify another system when new code is pushed

SECTION: customer-success/professional-services-engineering/partner-collaboration.md

Why Partners?

As the sales of GitLab increase, the demand for professional services will follow suit. To meet this demand we need to have an elastic and on-demand bench of delivery resources. Partner collaboration will also help to prevent PSE Burnout by allowing PSEs to take lead roles (e.g.architect, technical oversight, etc.). Finally, building relationships with partners allows the delivery team to add Subject Matter Experts as needed.

From a sales perspective, channel partners can help facilitate the initial licence deal and up-selling opportunities with customers whom they have an ongoing relationship.

Partner Disambiguation

There are different types of relationships we can have with partners and its important to outline the distinctions :pointdown:. Direct vs indirect is a reference to the way the services are sold - Direct means the partner sells direct to the customer, Indirect means GitLab sells services and the partner helps with execution.

	Partner Indirect (Staff Augmentation)	Partner Indirect (Project Based)	Partner Direct
Subcontracted to GitLab?	Yes	Yes	No
Access	Slack, www-gitlab-com, GDrive	Slack, www-gitlab-com, GDrive	Partner Portal
Communication w. GitLab PS	Organic (see above row)	Organic (see above row)	Partner Help Desk
Allowed to know of other Customers of GitLab PS?	Yes	No	No
Can contribute back to practice automation?	Yes	Yes	TBD

Partner Direct

GitLab PS can and should help our partners be successful in delivering services for their (and by extension, our) customers. We can provide guidance, examples and strategic advice, including references to public documentation or blog posts that could help "un-stick" a partner in an engagement. If the partner needs hands-on help, however, we will need to engage with the partner via an SOW to ensure we have appropriate liability protections in place.

Note: GitLab professional services is building out a means to field and respond to help desk questions from the channel partners who are not subcontracted with us (Jan/Feb 2021). More details to come as this process gets created.

Partner Indirect Collaboration Guidelines

- Partners (Indirect) (both flavors) should have access to any subgroup or project under global practice development
- PSEs should be maintainers responsible for MR approval and Merging new code from other PSEs and Partners (Indirect)
- Code reviews should happen on all merge requests
- Access to customer and PS specific Slack channels
- Partner Indirect can have access to AWS, Azure, GitLab Demo, etc.
- For delivery work on a customer engagement:
 - Partner Indirect (Staff aug)
 - Access to all of the delivery journal issues in PS Plan
 - Access to the global practice development group with all automation collateral
 - Partner Indirect (project based)
 - Specific access to the customer delivery (? need to check with Melani)
 - Access at the lowest level under global practice development to complete the customer project (as appropriate)

Collaboration by Type of Service

Implementation Services

- These services almost always involve actually building the infrastructure and configuring the GitLab components so maintaining a customer-free reference for IaC of configuration Automation tends to be harder
- Evaluate can be used by Partners (Indirect) (project based and staff aug).
- Partners (Direct) TBD
- As Partners (Indirect) deliver implementation services projects, they can use the

Implementation delivery kit

Make sure as you (and/or the partner) is delivering the implementation services, you contribute back to the delivery kit.

Migration Services

- Any migration to gitlab.com requires PSE involvement due to needing admin tokens to create users on gitlab.com
- Partners (Indirect) (project based and staff aug) can use Congregate and supporting automation utilities.
- As partners start migration projects, they can use the Migration Plan or the Migration Delivery Kit to help facilitate delivery discussions.
- When using Congregate, you will need to deploy it somewhere. If you need to deploy it within the customer firewall, make sure any hot-fixes you make to migration services source code you port back to the migration services projects.

Consulting Services

- Require discovery sessions to further define the problem space that customer is trying to solve
- Deliverable(s) for these services is
 - typically a written recommendation on how to solve the problem
 - sometimes proof of concept code customers can apply to their environment.
- All code developed for these services must NOT contain any customer information so we can reuse the project for future customers without reinventing the wheel.

Employing Partner/Consultants

If the project requirements exceed the current capacity of the available resources then the professional services team may employ a Consultant to help deliver the project. The following provides a checklist of items to process before and during the use of a subcontracted resource:

1. Partner Search

- Share "sample PS Projects" with viable partners
 - Advisory Project
 - Implementation Project
 - Migration Project
 - Project Management Project (coming soon)
 - Training Project (coming soon)
- Share "PSE Profiles" with viable partners
 - Advisory (Profile coming soon)
 - Implementation (Profile coming soon)
 - Migration (Profile coming soon)
 - Project Management (Profile coming soon)
 - Training (Profile coming soon)
- Sr. Channel Solutions Mgr Creates Establish PS Partnership Issue where we track completion of all necessary paperwork. We also track creation & completion of company profiles in required systems & tools. Please see list below:
 - Review & Signing of Master Subcontracting & Training Agreement
 - Review & Signing of Data Privacy Addendum & SCCs

- Partner Company Profile Creation in Procurement Tool (Coupa)
- Partner Folder Created in Google Drive
- Partner Profile Created in Partner Tracking Tool
- Partner Channel Created in Slack

1. Partner Vetting

- Sr. Channel Solutions Manager sends Skills Matrix Form for Consultant to complete prior to meetings with PS Team Members.
- Sr. Channel Solutions Manager goes over with Partner Principal how consultants can record a 2-3 minute video demonstrating their soft skills & consultative skills.
- Consultants must complete Soft Skills Course (upload their video to a google drive and share the link)
- Sr. Channel Solutions Mgr / Director of PS reviews/approves Soft Skills Course submission
- Sr. Channel Solutions Mgr confirms that consultants have completed the PSE Certification (at minimum the Migration & PM certs)

1. Partner Onboarding

- Partner principals requests consultants to register on GitLab's Partner Portal.
- GitLab Learn (Thought Industries)
 - Migration
 - Implementation
 - Training
 - GitLab Certified Security Specialist
 - GitLab Certified CI/CD Specialist
 - GitLab Certified Associate Pathway
 - GitLab Certified Project Management Specialist
- PSE Consultant Onboarding
 - Project Coordinator to schedule 30-45 min technical deep-dive with a Senior PSE to ensure consultant right match for project.
 - Interview results captured in partner tracking sheet
 - Sr. PSE approval needed to move forward with onboarding
 - Sr. Channel Solutions Mgr. creates an Access Request for consultant to gain access to necessary systems & tools for them to complete their project.
 - Sr. Channel Solutions Mgr creates & assigns an Onboarding Issue to consultant. They also schedule a call with PS Ops Team to go over operational tasks (including submitting project expenses (please see end of page for process)) & timesheet submission process.
 - Project Coordinator introduces Consultant to Project PM & kicks off Project.
- Project Manager Onboarding
 - Consultant PM completes GitLab Certified Project Management Specialist
 - Sr. Channel Solutions Mgr schedules 30 minute call with Director of PS or Sr. PM to ensure consultant is right fit for project. Approval is required to move forward with onboarding.
 - Sr. Channel Solutions Mgr. creates an Access Request for consultant to gain access to necessary systems & tools for them to complete their project.
 - Sr. Channel Solutions Mgr creates & assigns an Onboarding Issue to consultant. They also schedule a call with PS Ops Team to go over operational tasks (including submitting project expenses (please see end of page for process)) & timesheet submission process.
 - Consultant must complete onboarding issue and mark onboarding issue as completed
 - Project Coordinator introduces Consultant to Project Team & kicks off Project.

- Professional Services Operations Team Tasks
 - PS Ops Teams assigns an Onboarding Buddy
 - Onboarding Buddy will follow the Consultant throughout the project
 - PS Ops Team manages the Consultant onboarding journey.
 - Review all necessary operational tasks including timesheet submission.

Partner Onboarding

- PS Ops Team sets Consultant up in Kantata
- PS Ops Team meets with Consultant to review how to log time, etc.
- PS Ops Team submits Access Request Issues
 - Requesting access to appropriate technical tools (hardware & software)
 - Requesting to add Consultant to appropriate slack channel(s)
- PS GitLab Project Manager starts the project with the Consultant
- PS GitLab Project Manager tracks Consultant hours against SOW
- PS GitLab Project Manager keeps tabs on total burn vs. project burn to ensure Consultant can complete the project as per the terms of the SOW
- PS GitLab Project Manager raises risk of Change Order to PS Ops as appropriate
- Consultant holds weekly check-in outside of customer meetings, including with their onboarding buddy. Consultant and PS Onboarding Buddy ensure clear communication (as Consultant have less access to slack).

Consulting Subcontractor Prime Partner Statement of Work (SOW) Process

Consulting subcontracting Prime SOWs include the terms and conditions, such as rates and dollar amount for a partner to deliver Consulting on GitLab's behalf. Each partner has a dollar amount specified on the Prime Partner SOW. After the funds are exhausted, a new Prime Partner SOW is generated. Each Prime Partner SOW has corresponding Coupa requisition and Work Authorization assignments.

The Consulting Subcontracting Prime Partner SOW references the Master Professional Services Agreement, so this agreement, along with a Data Processing Agreement, must also be fully executed.

Sr. Channel Solutions Manager is responsible for managing the relationship with our subcontracting partners.

Process

- Sr. Channel Solutions Manager and Project Coordinator verify that there is a fully executed Master Professional Services and Data Processing Agreements in place with the customer. Follow up with the PS Sr. Channel Solutions Manager if necessary.
- After a mutual agreement has been achieved for the partnership, the Sr. Channel Solutions Manager sends an initial version of the Consulting Subcontracting Prime Partner SOW to the partner for review.
- If the partner makes redlines to the SOW, then the Sr. Channel Solutions Manager works with GitLab's Legal team and the partner to receive a mutually agreed SOW.
- The Sr. Channel Solutions Manager notifies the Project Coordinator of the partner Consulting subcontracting Prime Partner SOW initiation. The Project Coordinator will create a new checklist issue to be added to the PC Partner SOW Tracker board for tracking purposes.

- Upon receiving SOW mutual agreement between GitLab and the partner, the Sr. Channel Solutions Manager submits a legal case to add a legal stamp to the Prime Partner SOW.
- After receiving the legal stamped version of the Prime Partner SOW, the Sr Channel Solutions Manager sends it for GitLab and partner signature via DocuSign. Refer to this video for DocuSign basics.
- After receiving the fully executed SOW, the Project Coordinator follows the Zip process steps to submit a request and PO for the Prime Partner SOW.
- As the Prime Partner SOW is undergoing the signature and approval processes, the Project Coordinator will monitor the status and update the checklist issue on the PC Partner SOW Tracker board accordingly.
- After the SOW, Coupa req and PO are approved:
 - Project Coordinator saves a copy of the fully executed Prime Partner SOW in the partner SFDC account and the applicable partner Google drive folder.
 - Project Coordinator creates a partner and SOW-specific version of the Partner Invoicing SOW Consulting Funds Tracker within the applicable partner G-Drive folder.
 - Sr. Channel Solutions Manager sends a copy of the fully executed Prime Partner SOW to the partner.

Partner Scheduling Process

The Partner Scheduling Process is as follows:

1. The Project Coordinator reviews the internal capacity first prior to outsourcing to our partners for project delivery.
2. Once it is determined that we need to have a partner staff a project, the Project Coordinator will tag the partner lead in the partner slack channel with the project information.
3. After the Project Coordinator works with the partner lead on an agreed project assignment, the Project Coordinator will send the work authorization form for the partner to review and execute via DocuSign.
4. If the Partner Engineer is not vetted, the Project Coordinator will go through the partner vetting process outlined earlier.
5. If the Partner Engineer is vetted, the Project Coordinator will proceed and send the work authorization form.
6. The Project Coordinator will track the Work Authorizations against the funding on the Prime Partner SOW.

Consulting Work Authorization Form

The Consulting subcontracting Prime Partner SOW includes a work authorization form. The work authorization form is used to contractually secure a partner engineers and trainers for a Consulting and Training delivery. One Consulting or Training project should be listed on the Consulting or Training Work Authorization form. The PS Operations Team will initiate the work authorization form for the partner.

- Work Authorization include, but not limited to:
 - Scope
 - Technical requirements
 - Background check/security clearance requirements
 - Hourly rate

- Billing terms as determined in MSA, MPA or Sub-contracting Agreement
- Dates of work completed
- Travel and expenses (if on site required)

Delivery Kits

Delivery kits are comprehensive packages of resources, tools, and documentation that partners can use to streamline the delivery of GitLab professional services. These kits include:

1. Project templates and checklists
2. Best practices and guidelines
3. Technical documentation

Partners have access to Delivery Kits. They are encouraged to use these kits as a starting point for their engagements.

Each kit is regularly updated by the GitLab Professional Services team to ensure partners have access to the latest methodologies and tools for successful service delivery.

Time Sheet Submissions

Each week, the Partner will submit their timesheets into our PSA tool by the end of their business day.

Timesheets are due on the Friday of each week. It is imperative that all timesheets are submitted into the PSA tool weekly by the deadline!

Month end deadlines for timesheet submissions are posted in the partner slack channels at month end. Reminders are submitted mid-month as we lead up to the month-end deadline. If there are further questions, please review with Project Managers or the Operations team.

Partner Monthly Invoicing

After each month end, our partners will submit their invoices for time spent on our projects into the Coupa Procurement System. The PC assigned will receive an email notification that there is an invoice waiting for approval.

Invoices should be submitted in Coupa on the first week each month for the previous month. For example, work performed between May 1-31 would be submitted in Coupa on the first week of June. If invoices are not submitted by the 15th of each month, the PS Operations Team will follow up with the Partner lead to ensure the invoices are submitted on time.

Invoices should be submitted in Coupa with the following details:

- Partner Name
- PO Number
- Dates of work performed
- Name of Consultant
- Name of Project
- Hours worked
- Hourly Rate
- Total

See Example

There should be 1 invoice submitted each month for each partner, then have a line broken out for each project.

If there is a need to have multiple invoices submitted each month, then approval would need to be obtained from the Operations Manager

If additional support is needed, please, be sure to reach out in your partner slack channel.

Coupa Helpful Resources:

Coupa Supplier Portal

Coupa End Users Guide

Customer Project Onsite Travel

When a GitLab Partner Travels:

Before making a purchase of any type or booking travel for a customer project, be sure to obtain approval from your Project Manager or Project Coordinator. The Project Manager or Project Coordinator will provide the travel budget to the partner. Once the travel has incurred, the expenses should be submitted for invoicing through Coupa and include the following details:

- Expense report per this template that includes a separate line item for each expense
- One PDF document to include receipts for each expense
- Guidelines for Traveling
- Expense Guidelines

Expenses are to be invoiced in the month in which they have incurred

Partner Offboarding

- PS Project Manager invites Consultant to Project Retrospective meeting (as appropriate)
- PS Project Manager submits an Access Request to:
- Remove the Consultant from the customer project slack channel
- Remove access to any project specific GitLab tools or development work spaced
- Ensure Consultant is not working on any other ongoing projects

SECTION: customer-success/professional-services-engineering/practice-mgmt.md

Practice Management Overview

The professional services practice management team is responsible for maturing current service offerings and creating and bringing new offerings to market. This page will help describe the areas of responsibility of the practice management team, how we operate and stay organized.

Functional Areas

1. Channel Solutions Management - scaling service selling and delivery through channel partner leveraged approach.

1. Engagement Management - positioning, selling, scoping and coordinating signature of customer engagements. Check out the Engagement Management page for more information

1. Practice Management - building, maintaining, and bringing to market service offerings to be sold and delivered by GitLab PS and our partners. Also, improving back-office processes to decrease overall cost of revenue.

Meet the team - Lets Chat

You can check out our team on the team page here. We are most reachable via the ps-practice slack channel.

Backlog, Workflows, and Kanban Board

We use the PS-Practice-Management project to track our backlog of issues.

We use a few different kanban boards in this project to help track work from ideation to completion.

- We use the scoped labels starting with ps:: e.g. ps::todo to track progress on issues.
- We use the EMprocess label for engagement management and pre sales process improvements
- We use the PM-process label for project management and delivery process improvements
- We prioritize using priority::1, priority::2 and priority::3 labels

Education Services practice management Labels

Here are the main labels specific to the Education Practice Management projects.

- ProServ-practice::Education (TO BE DEPRECATED in favor of these scoped labels at the customer success group level)
- Workflow::validation backlog - Team member identifies audience needs and potential education services offering
- Workflow::problem validation - Practice manager validates needs addressed by proposed Education Services
- Workflow::design - Practice manager defines solution component requirements and confirms with ID that the proposed solution is feasible
- Workflow::solution validation - Practice manager validates proposed Education Services solution will meet business objectives
- Workflow::planning breakdown - Practice manager works with ID to plan project work with issues and epics

Go to market workflow for new offerings

Education Services

Sales-team-assisted go to market motion

1. When new Education Services are launched they include internal communications and collateral to sales reps

- Announcement of availability in public sector and sales slack channels
- Include in Sale Enablement training
- Offering description pages on /services
- Success Stories collateral
- Slides for sales decks
- Inclusion of offering in Services Calculator
- If applicable, Standard variant with:
 - Standard SOW
 - Finalized SKU for use by Sales

1. Rep advises customer on which Education Services are needed

1. Sales rep adds SKUs to customer contract

1. PS delivers Private Onsite or Remote ILTs

1. Education Services provisions account-level subscription access to LXP for all LXP subscription SKUs

Web-direct go to market motion

1. When new Education Services are launched they include external communications to GitLab ecosystem as per the Marketing Strategy, including:

- Nurture campaign emails
- In-product banner
- Recommended by SA or CSM
- Included on Training Tracks page
- Included on Education Services pages
- Mentioned in product release updates
- Highlighted in blog post

1. Individual users click Order button and pay using credit card from customers.gitlab.com and from within LXP

1. Users attend Public Remote ILTs via Zoom Webinar

1. Users access certification learning paths from LXP

Marketing Strategy

- Add to customers.gitlab.com ordering page: Gives visibility and leads user down path of discovering more offerings

- Event Presence: Education Services presence at Commit

- Community and Evangelism:

- GitLab Heros: Pilot with GitLab Heros to test out certifications. Have Heros participate in training in advance of commit and then iterate based on that. Offer trainings for free and offer free exam to get GitLab certified ahead of time (John Coghlan is contact)

- GitLab Evangelism team: Collaboration initiatives TBD

- Add to Customer Success Plan: Make certifications part of success plan from CSM. Set metrics against percentage of users who complete certifications

- Offerings integrated into customer adoption nurture campaign

- In-product awareness

- Direct marketing on 3rd party platforms/communities where target audience lives

- edEx, EdCast Leapest Marketplace, LinkedIn, Dice.com

- Blog posts -- GitLab and 3rd party sites (eg StackOverflow, FB)

Practice Management How to

How to create a new service SKU

SKUs for new PS offerings are requested by the PS Practice Manager. To request a new SKU, the Practice Manager must determine and complete the following items and steps to gain approval.

Required items

- A specimen SOW that can be referenced by the Item
- Established cost-basis and assumptions
- Hours and hourly cost
- Delivery cost (hours x hourly cost)
- Included T&E assumption (if any)

Steps for creating a SKU

The Practice Manager follows these steps to request creation of a new SKU.

1. Create an issue in the Finance issue tracker referencing the above requirements
1. Review with the Finance Business Partner for Sales
1. Make any require changes
1. Include an executive summary with the business rationale
1. Submit to VP of Customer Success for approval
1. Submit to CFO, CRO and CEO for approval
1. Once approved, add a comment for the accounting team to create set up the SKU in Zuora
1. Add a comment for Kim Stagg to add the product to the Price Book and to provide you with the SKU number/Channels part number. In your comment include the Product Name and Product description. Updates to the Price Book will be released to distributors quarterly.
1. Once the product has been added to the product catalog and Price Book, update the services.yaml file to include the new product details.

Validating SKU shows in Salesforce

1. Login to salesforce.
1. Click on the opportunities tab.
1. Search for the Test Account-NEW opportunity.
1. Scroll down and click on the New Quote button.
1. In Sold To Contact and Bill to Contact, select PS Test account.
1. Add start date as today.
1. Scroll down and click Next.
1. Click the drop down the box next to New Quote Flow and select Add Add On Products.
1. In the Professional Services and Training Row, click the drop down that says Select Plan to see the current SKU offerings that the Sales Reps see.

How to retire a service SKU

Retirement of SKUs for PS offerings is requested by the PS Practice Manager. To request retirement of a SKU, the Practice Manager follows the same basic steps used for creating a SKU to gain the appropriate approvals, including using the same issue template.

How to edit a Professional Services product page

PS uses a file called `services.yml` as the single source of truth (SSoT) for offering descriptions and specifications. This file is used together with a documentation macro to populate various parts of the GitLab documentation and is also used by the Services Calculator. The Services SSOT Wiki Page describes its various applications, attributes and maintenance processes. Team members who wish to update or add offerings can follow the instructions located on the wiki page.

Developing software for a new service/initiative

Refer to [Developing Software For Professional Services](#) to check out our common software stack and development processes

Setting up your development environment

For new Practice Engineers and Professional Services Engineers, refer to the [setting up a development environment tutorial](#) to install all the necessary underlying tools we use for development.

SECTION: customer-success/professional-services-engineering/professional-services-tooling.md

Professional Services has a series of tools and applications that assist with our day-to-day operations and delivering services.

We strive for our tooling and applications to follow some common design structure patterns.

All of our tooling resides within the Professional-Services-Automation group on [gitlab.com](#)

Standard Setup

Python

We use Python for the majority of our backend development. Our dependency manager of choice is Poetry.

REST API

Our default REST API framework is Flask.

Default Libraries

Outside of the testing libraries list below, we have a common utilities library called GitLab PS Utils that contains several helper functions and classes to speed up prototyping and development time.

Javascript

We use Javascript for any frontend development. Our Javascript framework of choice is Vue.js. We manage our Javascript dependencies with NPM and manage our Node/NPM installations through NVM.

Databases

We use MongoDB or DynamoDB. We interface with MongoDB using PyMongo and DynamoDB with PynamoDB.

Local Testing

If we need to mock any AWS resources outside of AWS, we use Localstack.

For python testing, we use a mix of Pytest, mock, and unittest.

Packaging and Deployments

We package our tools into Docker images or Pip packages. Our evaluate tool, for example, is packaged up into both. All our docker images are deployed to the tool's container registry on GitLab.com.

If we need to deploy any serverless WSGI-based applications to AWS, we use Zappa

Example folder structure

bash

```
... ps-tool          Root of git repo
  ... Dockerfile      Dockerfile for packaging
  ... ps-tool         Python source directory
  . ... ..            Any python code
  . ... init.py
  ... LICENSE
  ... poetry.lock      File generated by Poetry listing all installed packages. Must be
source controlled
  ... pyproject.toml   Dependency file used by Poetry to track dependencies
  ... README.md
```

SECTION: customer-success/professional-services-engineering/remote-training-session-setup.md

Professional Services Remote Training Session Setup and Reporting

Professional Services has a shared Zoom account for remote training deliveries to customers. This enables the entire team to schedule, modify, and start training sessions from the same account, as well as access all session recordings and attendee reports. This page describes the procedure for setting up training sessions and accessing post-session recording and reporting.

Log in

1. Obtain the login credentials for the Professional Services Zoom account from the 1Password

team vault.

1. Open up an incognito browser tab and navigate to the Zoom sign in page to log into the shared account.

Schedule the training sessions

1. In the Zoom shared account, click Webinars from the left navigation menu.

1. Check the list of scheduled webinars on the Upcoming Webinars tab to make sure none are scheduled to overlap with the one you need to schedule. Important Note! Zoom does not allow concurrent meetings or webinars to run from the same Zoom account. Even if you designate an alternate host, one of the meetings or webinars must be ended in order for the other session to initiate. If you see a webinar already scheduled that overlaps with the time slot you need to schedule, you must use a different Zoom account to schedule the session. For details see this [Zoom help article](#).

1. Click the Webinar Templates tab.

1. Locate the template name of the course you want to set up the session for.

1. Click Schedule a Webinar with this template.

1. In the title for the session, add the customer name. For example, "GitLab CI/CD Training -- Acme Corporation."

1. Adjust the date and time.

- Each course includes two 4-hour sessions. Select the date of the first session
- Adjust the start time to the confirmed start time in the customer's preferred time zone.
- Adjust the duration to be 4 hours.
- Adjust the time zone to match the customer's preferred time zone.
- As needed adjust the recurrence so that it matches the confirmed date for the second 4-hour session.

1. Leave the settings as-is for Registration, Password, Video, Audio, and Webinar Options.

1. Set the Alternative Host.

- Click Advanced Options and enter your email address. This will enable you to join the session as the host from your own Zoom account.
- Click Save.

Adjust the registration page

Zoom templates do not include most of the branding used to set up the original template, so you'll need to make some adjustments for each webinar you schedule.

1. Scroll down to the bottom of the page for the webinar you just scheduled and click the Branding tab.

1. In the Title section click Edit.

- Change the title to say the name of the training and the customer's name (for example,

"GitLab CI/CD Training for FRB Kansas City").

- Click Save.

1. In the Speakers section click Add a speaker.

- Upload a photograph of yourself.
- Enter your name and title.
- Enter "GitLab Professional Services" for your organization.
- Enter your biography to let the audience know a bit about you.
- Click Save.

1. Under Post Attendee URL, you can click Edit to adjust the URL you want attendees to see when you end the webinar session as needed.

1. Click Save.

Restrict the number of registrants

1. On the Invitations tab in the Approval Options section click Edit.

1. On the Registrations tab check the box for Restrict number of registrants.

1. Enter the number 20 in the field to limit the number of registrants to 20.

1. Scroll to the bottom of the Registration pane and click Save All.

Adjust the email settings

1. Click the Email Settings tab at the bottom of the webinar page.

1. For the Email Contact row, click Edit and change the email contact name and address to your own. This will result in all automated emails received by attendees to be from your email address.

Add the survey link

1. On the "Polls/Survey" tab in the Survey row, click Use a 3rd party survey and paste in the link to the training survey.

- This will result in the survey popping up for each attendee immediately after you end the session.

View and communicate the registration page link

1. Copy the registration page link.

1. Click the Invitations tab at the bottom of the webinar session page.

1. Under Invite Attendees click Copy Invitation.

1. Select the Url shown in the invitation message and copy it.

1. Open another browser tab and paste the link in. This will show you the registration page attendees will see. Review it and if you need to make any adjustments go back to the Branding tab to do so.

1. Paste the registration page link into the issue for the training session.

1. Also paste the link into the email you will send the point of contact at the customer so that they can forward the link to each attendee for each to individually register ahead of time.

View and export registrations and attendance for a session

Pre-session

1. In the Upcoming Webinars tab, locate the session you want to see and click the Topic title.

1. At the bottom of the webinar session page on the Invitations tab, scroll to the bottom and in the Manage Attendees section click View.

1. You will be able to see each attendee who registered. If you click on a name, you can view the responses to the registration page questions. This will help you prepare ahead for the training session based on the mix of attendee roles and goals for the session.

Note: You will not be able to export the registration list ahead of the session.

Post-session

1. In the Previous Webinars tab locate the session you want to view and click the Topic title.

1. At the bottom of the webinar session page on the Invitations tab, scroll to the bottom and in the Manage Attendees section click View attendee report.

1. You will be able to generate a number of different reports and export them to a spreadsheet format.

1. Select the Attendee Report radio button and select the webinar session. Click Generate CSV Report.

1. Attach the Attendee Report to the issue.

How to access recordings

1. Click Recordings from the left navigation menu.

1. Locate the webinar session you want to access.

1. Click Share.

1. Click Copy Sharing Information to the Clipboard.

1. Paste the recording access information into the issue and into the follow up email you send the customer.

SECTION: customer-success/professional-services-engineering/remote-training-tips.md

Making the transition from onsite trainer to remote trainer can be a challenge · there's a lot more you need to do to keep people engaged when the distractions of email, slack, browsing, and environment are outside of our direct control. Here are some tips and tricks developed by the GitLab Professional Services team, for presenters facilitating remote training sessions using video conferencing and webinar tools.

Tips

Tip 1: Turn on video for all participants as appropriate

When you can see participants it keeps them accountable for paying attention, and you'll be able to observe the non-verbal cues indicating a wane in attention. On the other hand, if you have a large number of participants, having everyone's video on at the same time can be distracting -- in that case, you can invite specific participants to turn on their video when they are speaking. Also keep in mind that some participants may not be comfortable with sharing their video -- be sensitive to this and do not make video sharing a requirement.

Tip 2: Take frequent breaks

If your session will last more than 90 minutes, build in a break at least every 60 - 75 minutes. Let attendees know what time they need to return, and request they indicate their return by turning their video back on and/or raising their virtual hand (if that tool is available in our video conferencing software).

Tip 3: Break up a full day into two days

For a session you would normally deliver in 1 day onsite, break it up into two 3-4 hour sessions on two separate days. In between the days you can assign homework so that attendees can practice applying what they learned or complete pre-work ahead of the second session.

Tip 4: Ask frequent questions

At least every 10-15 minutes, ask attendees a question they must respond to. You can ask them as a group and wait for volunteers to answer. But if you're not getting a variety of attendees participating in providing responses to your questions, your next go-to approach is to randomly call on a participant individually to answer a question. This will motivate everyone to pay attention so that they are prepared when you pick on them. You might also consider employing the "attention getters" meaning smartphones, and have a session manager send questions as text messages to the learners' phones. In this way, the learners have learning collateral with them during and after the class session.

Tip 5: Encourage attendees to ask questions

At the beginning of the session show attendees how to ask questions using your video conferencing tools, whether that is virtually raising their hand or submitting questions using a Chat or a Q&A tool. Take frequent designated Q&A breaks at least once or twice per 60 minutes of instruction. In terms of the kind of questions you elicit, you may want to get to a point where the audience is not regurgitating the past. Rather, your learners begin to intuit what might be possible, and in that way, they begin to project their intuitions about the concept into the future. This type of engagement by the learners creates positive instructional opportunities, which can reduce learners' resistance to public speaking and improve observable attentiveness (e.g. smiling, nodding, shaking the head, using reactions, and chatting to everyone with questions).

Tip 6: Have a team member join as a moderator

A team member can play the role of session manager, managing questions coming in from the chat and being timekeeper, reminding you of breaks and Q&A points.

Tip 7: Minimize the text on your slides

- Avoid using text on your slides and use them as visuals to reinforce your key points.
- Include notes for yourself in the presenter notes area of your slides but use these only as key points -- do not read them out loud verbatim. Your audience will be turned off listening to you read.
- Provide attendees with access to the slides as soon as possible after the session.

Tip 8: Build in frequent activities

Include at least one activity for each hour of instruction. If possible, adjust the flow of your content so that attendees can jump right into their first activity within the first 20 minutes of your session.

Tricks

Here are some of our go-to techniques to encourage remote engagement and collaborative learning.

Group note taking

- Create a shared Agenda/Notes document, for example a Google doc, and include the link to the file for all attendees to access.
- Populate the document with an outline of the topics you plan to cover.
- Direct attendees to take on group responsibility for taking notes during the session, especially when you are answering questions so that your responses are captured in the file.
- Make the file available to attendees after the session for their reference.
- If you have a post-session quiz you can include the link in this document.

Pinning

If your video conferencing software includes "pinning" capabilities, use these to your advantage to increase participant attentiveness.

- Adjust the settings so that as the presenter your video is always pinned as the main or largest video window during the presentation portions of the session.
- When you reach Q&A or interactive sections of the session, adjust your video setting again so that the active speaker's video is always displayed largest.
- When calling on specific attendees to answer a question, pin their individual video so that it is the largest one displayed.
- If your video conferencing software includes "panelist" and "attendee" roles which control who can display video, promote selected attendees to "panelist" so they can turn on their video as they respond to your question live.

Polls

If your video conferencing software includes "polling" capabilities, use them to increase engagement and interest.

- Set up polling questions in advance of the session and plan specific points in your session flow to display each question.
- Introduce each polling question and ask all attendees to participate in responding.
- Give attendees 30-60 seconds to respond, giving them a time check about 10 seconds prior to closing the poll
- Display the results of the poll for all attendees to view
- Share your thoughts about the poll results and connect the results to the topics you are about to cover.

Recording

- Record the session and make it available to attendees as well as individuals who registered but were unable to attend the live session.
- To ensure compliance with privacy laws, if your attendees are not employees of your organization, adjust your recording settings so that attendee video, names, and in-session chat messages are not recorded. During the session avoid using attendees' full names when calling on participants.
- Make the recording available in an asynchronous learning environment to scale availability of the training beyond current registrants and attendees.

Chat/Q&A pinning

Be sure to practice ahead of time with pinning your video conferencing Chat or Q&A panes to your window while you are in presenter mode with your presentation slides. This will enable you to quickly bring these panes into view so you can see questions coming in and respond in a timely manner during the session. Most video conferencing systems offer a variety of options for doing this whether you have dual monitors or a single monitor (for example, here are recommendations for pinning Chat while sharing a presentation in Zoom).

Taking and ending breaks

- When it's time to take a break, let attendees know what time they need to return.
- Add a note into your Q&A or Chat tool to indicate you are on a break and what time attendees should return.
- When the break is finished, ask attendees to use the "raise hand" tool to indicate they are

back if you aren't able to see everyone on video.

Avoid too much of a good thing

- If your video conferencing platform offers multiple tools for communicating with participants -- for example Chat and Q&A -- consider using just one of these tools instead of both. This will reduce complexity and make it easier for participants to have all communication in one place. Zoom Webinars allows you to restrict Chat to panelist usage so that attendees can only use the Q&A tool for communicating their questions.
- Use a mixture of lectures, questions, discussions, demos, and lab activities. Don't rely on just one technique -- participants can become bored when too much time is spent using one method. On the other hand, avoid too much mixing or alternating too frequently between techniques, which can become disjointed or confusing for participants. It's all about finding the right balance for your audience.

Share the content, not your screen

Adhering to the F-shaped pattern for reading, it makes little sense to share your full screen. This UX rule may affect the way in which presentation content is developed: minimize the amount of right, white space that the learners need to see. Also, when presenting content, employ the F-shaped rule where the first line is the topic, and the following 2-3 lines are supporting sentences. From a development perspective, presentations with bullets would only include 3-5 topics, with supporting content in the presentation's speaker's notes.

If you're sharing your Terminal window, share your Terminal window

Our Terminals are our babies, and we nurture them with beautiful styles including backgrounds, fonts, and sizes. But if we consider what this looks like to our learners, who are limited by the size of their monitors and Zoom windows (you're showing a window in a window), our babies look like small, malformed, screen blips. What we need to do is increase the font size and create better contrast between the background and the font color. Also, as system log messages often print in a different color than your input text, be sure to configure the sys log output as well.

Overview

This sales enablement page is designed to help the GitLab Sales team understand our professional services offerings, how to position them to customers, and the workflow for selling services.

1. Current state & improvements
1. Services: Positioning and Process
1. Where to go for help -->

Professional Services: What, Why and How

What

So you've won a customer's business with a subscription deal to use GitLab, congratulations! Now you can focus on establishing a foundation of trust to grow the relationship. In order for your customer to get the most out of GitLab consider engaging them with Professional Services.

Our team can help your customer accelerate their GitLab Adoption journey from Onboarding to Source Code Management Consolidation, CI/CD Modernization, DevSecOps Transformation, and Value Stream Management by delivering services to improve operational efficiency, accelerate time to market and reduce risk through GitLab product adoption.

We accomplish these by offering categories of services to help ensure the initial GitLab rollout goes smoothly so the end users can get value as fast as possible.

Migration Services

We offer data and user migration services to enable the customer to come from a variety of legacy systems (both SCM and CI/CD). We work closely with the GitLab import API team and have automation tools to facilitate the migration. We are continuously improving them with every nuanced customer migration service we provide.

Migration services are always custom-scoped because of the variability of level of effort based on the amount of data and number of users in the source system(s), except for our Migration QuickStart SKU, which supports a smaller, more controlled migration at a fixed cost.

Implementation Services

When customers choose GitLab Self-Managed, they typically need help building and configuring their software to meet their non-functional requirements (e.g. Availability, Performance, Security, Upgrade, GEO, Disaster Recovery, etc.). Our team of experts maintains an Implementation delivery kit to facilitate this while leveraging gitlab reference architecture best practices.

For GitLab.com users, focus mostly on how to organize GitLab groups and projects, how to establish role based access control, and other front end strategic decisions that typically need to be made up-front.

The Implementation QuickStart GitLab.com and Self-Managed (HA) packages have a standard SKU, but have specific bounds to the large cloud service providers and HA/DR architectural patterns. If your customers' needs fall outside of those bounds, you will need to engage in a custom-scoping exercise.

Education Services

As with any new software being introduced at a company, users tend to need training to know how to use it. We have excellent education services that span the spectrum of basics to advanced; administrators to general users. All of our education services have standard SKUs, which makes the process easy for the ISR/SAE to offer to a customer. We've also begun to offer custom education services as well as scaled trainings to Customers.

CI/CD Services

We discussed in the migration services about moving data from source CI/CD systems over to GitLab CI, but we also offer a CI/CD Workshop SKU that allows us to demo GitLab CI features and then provide strategy and roadmapping advisory sessions to Customers to ease their adoption of GitLab CI. Additionally, we offer T&M services to help with large scale and/or custom CI/CD modernization efforts.

Security Services

With GitLab Ultimate, Professional Services can deliver a DevSecOps Workshop SKU that allows us to demo key GitLab Ultimate security features and then provide strategy and roadmapping advisory sessions to Customers to ease their adoption of GitLab Ultimate. Additionally, we offer T&M services to help with large scale and/or custom Security transformation efforts.

Why GitLab Professional Services?

Customer

- Faster value realization - Help the customer setup the GitLab instance and migrate their data and users quickly to accelerate time to first value. Paired with education services to ensure the users know how to use the newly setup GitLab system is the way to the fastest initial adoption and sets the foundation for future stage adoption.
- Improved customer experience - Establishing best practices up front with our expert recommendations is the path to a great customer experience.
- Access to GitLab experts / best practices - On top of our team of experts, we can reach back to engineering and support to put the full weight of GitLab into solving a customer issue.

GitLab

- Improved retention and expansion - When customers get started with GitLab on the right foot, they spend less time on debt work (e.g. infrastructure maintenance or) throughout their subscription period
- Customer insights and feedback - The PS Engineer will be working hands-on with the customer team and often gains insightful feedback on the software and customer relationship.

How will we deliver?

1. Direct via the GitLab Professional Services Engineering Delivery team
1. Partner delivered

How to order

Ordering services is done through an Off-the-shelf SKU or a custom-scoped Statement of Work. See the selling services workflow for more details.

For custom SOWs, initiate the PS epic and associated scoping issue process to capture the requirement by creating a child PS opportunity off of a parent license or subscription SFDC opportunity using the Create Services Opportunity button, and collaborate with your local Professional Services Engagement Manager.

SECTION: customer-success/professional-services-engineering/selling.md

You can also watch the sales enablement session about how to sell services.

A Note on Partner Professional Services

Please remember to follow the Rules of Engagement for Selling Professional Services with the following highlights:

- Always start by finding out if your customer/prospect has a qualified and preferred professional services partner and start by engaging with that partner to explore a solution for your customer/prospect
- SMB clients are welcome to purchase SKU offerings. Please route all custom SMB needs through professional services Channel Partners as outlined in the ROE. Please see additional detail in the FAQ below.
- Remember to update the SFDC Professional Services Opportunity to "closed lost" if for any reason after you have created a GitLab Professional Services Opportunity in SFDC the work is transitioned to being sold and delivered by a partner. Then make sure that any Services Attach Registration that the partner registers for that work is attached to the relevant Licensing Opportunity in SFDC. Please work with the Channel Account Manager for the partner (found in SFDC account for the partner) if you have any questions about this process.

Workflow for GitLab selling Professional Services

There are 4 main steps for selling GitLab Professional Services:

1. Identify the right services needed.
1. Create the GitLab Professional Services opportunity in SFDC (for non-SKUs).
1. Generate the SOW / Service Description Docs
1. Close the opportunity

mermaid

graph LR;

a["Standard services?"]-- Yes ---b["Add SKU to quote"];

a-- No ---c["AE/SA auto creates PS epic with Create Services Opportunity button"];

c-->d["AE/SA works w/PS to finalize SOW"];

```
z["Send customer proposal"];  
d-->z;  
b-->z;
```

Step 1: Identify the right service

The SAE/ISR can find the general services the PS team offers on the full catalog. The SAE/ISR can pull the SA/CSM in for help selecting services needed based on customer requirements.

Step 2: Create the opportunity in SFDC

The SAE/ISR creates a Professional Services Only opportunity.

Standard Services Only

If the customer only needs standard services from the service catalog, the SAE/ISR can generate the quote from within the newly created SFDC PS opportunity by:

1. Click New Quote.
1. Choose the proper billing account. In the Quote Type section Select New Subscription. Click Next.
1. On the Create New Subscription Quote screen, update required fields (e.g. Start Date) as needed. Click Next.
1. On the New Quote Flow screen, click the drop down box next to the New Quote Flow and select Add Add on Products.
1. In the Professional Services and Training Row, click the drop down that says Select Plan to see the current SKU offerings that can be added to the opportunity. Click Next.

After following the above process steps, click Generate PDF to obtain an Order Form to share with the customer for signature. The AE should meet with the customer to review the service deliverables, duration, and pricing and should confirm no customizations are needed. Again, they can pull in the EM for assistance if needed.

Custom-Scoped Services

If the account team (SAE/ISR/SA/CSM) determines that the customer requires additional services outside of those listed in the full catalog, they should initiate the creation of a PS epic and associated scoping issue by using the Create Services Opportunity button from a standard parent license or subscription opportunity to create a child PS Opportunity. This will add an issue to your assigned PS Engagement Manager's queue to follow up with you on next steps. Check out the detailed steps below for custom-scoped engagements for more details.

Instructions for creating a Professional Services Quote

Deal Desk with require a quote for either Service option above. How to create a quote can be found [here](#).

Step 3: Create and add the SOW

For standard SKUs, the Order Form is generated directly from SFDC via the quote object here. Upload the signed version of this document when you receive it from the customer.

For custom scoped SOWs, once you receive the SOW from your assigned Engagement Manager and have gotten it back from the customer with signature, attach it to the SOW doc to the SFDC PS opportunity.

Step 4: Close the opportunity

Closed Won

Once the services have been rendered and the project is closed, the SAE/ISR should obtain signatures from the customer. The SAE/ISR should move the opportunity to Closed Won status

As the agreement approaches Closed Won, make sure to request @ps-scheduling to identify a potential start date in the professional services slack channel given the typical lead times for starting a PS engagement.

Transitioned to a Partner - Closed Lost

Remember to update the SFDC Professional Services Opportunity to "closed lost" if for any reason after you have created a GitLab Professional Services Opportunity in SFDC the work is transitioned to being sold and delivered by a partner. Then make sure that any Services Attach Registration that the partner registers for that work is attached to the relevant Licensing Opportunity in SFDC. Please work with the Channel Account Manager for the partner (found in SFDC account for the partner) if you have any questions about this process.

Custom-Scoped Services Detailed Workflow

1. Account team: Create a child PS Opportunity from a standard license or subscription parent opportunity using the Create Services Opportunity button.
1. SA/CSM: Add initial scoping details to the automatically generated scoping issue around customer requirements
1. SA/CSM & PS Engagement Manager: Conduct detailed scoping call with the customer
1. PSEM: Develop Custom SoW and pricing for customer
1. Account team: Deliver SoW to the customer, add to the Salesforce (SFDC) opportunity
1. Send for signature (just like software terms)
1. When Closed Won, the PS team will handle staffing. Average lead times are updated weekly - please check with the EM to set expectations with the client

<!-- Detailed Process

1. Sales and account team to introduce early in discussions.
1. The SA can do basic scoping and use the calculator for an estimate.
 - This should be a good estimate to secure budget.
1. Customer should execute Subscription Agreement AND Consulting Services Agreement.
1. The SA can use the custom SoW scoping details page to help drive the conversation and uncover required capabilities for the custom SoW.
1. The SA will create the SoW from the calculator, scoping the project and estimating both schedule and cost for the SoW.

1. The calculator automatically creates an approval issue on the SoW Proposal Approval board.
1. SA: Check and add any more details to the issue created on the SoW Proposal Approval board.
1. SA: Fill out any additional scoping details. Ensure the issue is assigned to a Solutions Manager for review, and move it to the proposal::Scoping step.
1. SA & PSE: Conduct more detailed scoping call (only when needed) to prepare SoW.
1. If there are additional scoping questions needed to scope the engagement, Professional Services Engineering will inform the account team within three (3) business days of this call.
1. Once all scoping questions are complete, move the SoW to the proposal::Writing step.
1. Once written, move the SoW to the proposal::Cost Estimate step where a Manager of Professional Services will provide a cost estimate used to calculate the expected margin for the project. It will be completed and ready for the account team review within one (1) business week.
1. Move the SoW to the proposal::ReadyForApproval step.
1. The SoW is approved by the Senior Director of Professional Services or VP of Customer Success.
1. Move the SoW to the proposal::Approved step. Assign the issue to the SA for delivery to the customer via the account team. -->

FAQ

Do we have set SKUs I can use?

Yes - for off the shelf items, we have SKUs.

What are our daily or hourly rates?

We do not currently have an hourly or daily rate. Nor do we plan to have an hourly rate. Just as with GitLab support, the mission of our Professional Service group is not to bill hours, but to achieve success for our Customers. So just as we don't offer support by the call or by the hour, we do not offer Professional Services by the day or the hour.

In the future, we may have a daily rate or a daily rate for on-site support. However, we currently do not for the same reasons listed above.

What if the customer only wants training?

If the customer is an EE customer, we can offer training. We have training SKUs also listed in the SKU link above. However, custom training will need to be scoped out by the Customer Success department before quoting a price. The account executive will also be required to provide the use case for the need for just training.

Example use case might be:

- Customer is under license utilization and we need to prevent churn, help expand usage into additional groups and other business units.

What options exist for CE Customers?

GitLab CE is ideal for personal projects or small groups with minimal user management and workflow control needs. Because these groups don't typically need a lot of focus on scaled

implementation or training, we currently do not offer implementation, integration or training services to our CE customers. Many of our partners offer such services. However, we find that many customers who have been running a CE instance and are looking to transition to a scaled implementation of GitLab may require a Discovery Engagement to determine the customer's long-term needs.

If a customer is upgrading from CE to EE, Professional Services should be engaged to scope out the requirements for the transition if the customer will need services in the transition.

What options exist for SMB Customers?

SMB customers often do not have sufficient budget for our professional services offerings, and we traditionally try to meet their needs through channel partners. If your client had budget for one or more of our SKUs, you are welcome to attach the SKU and do not need to create a scoping issue with the professional services team.

Please note: Migrations to GitLab SaaS currently require the use of an admin token, which is unavailable to partners. Therefore, these migrations must run through our GitLab professional services team currently.

SECTION: customer-success/professional-services-engineering/skus.md

Some Professional Services Offerings, such as non-customized Education Services courses, Health Check, CI/CD and DevSecOps Workshop, Implementation/Migration QuickStart SKUs, and other out-of-the-box packages can be sold as a standard SKU. Professional Services SKUs can be easily added to an order within Zuora and do not require creation of a custom SOW.

<!-- Important Note: The GitLab System Administration Basics and GitLab Advanced System Administration courses should always be ordered using the custom SOW process so that we can review the customer's deployment variables and create a custom list of topics for them with the appropriate pricing depending on the scope of the topics needed. Once the trainings are scoped, they can be ordered using the new hourly rate Training SKU for ProServ Education Services in Zuora/SFDC.

Below are the current SKUs broken out by services category. For a detailed list including pricing see the Full Catalog page.

Implementation and Integration Services Standard SKUs

```
{{% customer-success/sku-tables categories="Implementation,Integration"
maturities="Viable,Lovable,Minimal" %}}
```

Education Services Standard SKUs

Currently, the following Education Services course SKUs are available within Zuora and can be added to any quote without using the Services Calculator or a SOW. Most courses have both an on-site and a remote delivery SKU. In the case of onsite delivery, travel and expenses (T&E) is billed separately to the customer based on our Professional Services terms and sponsored travel

policy. Customization of any of these standard courses will require use of the Services Calculator and further project scoping as well as the custom SOW approval process and signature by customers.

Update: Per-Seat Training SKU

Now Available: Training seat add-ons! Customers who want to add on to the 12-person limit for training sessions can now do so by ordering the new ProServ Training Per-Seat Add-on SKU. Priced at \$500 per added seat, this is an easy way to accommodate additional attendees and avoid the need to order a full additional training delivery for customers with more than 12 trainees.

Here are answers to anticipated frequently-asked questions.

1. Why are seats limited to 12 per class for standard training? A class size of 12 is optimal for the best learning experience given the amount of hands-on activities covered during the training sessions. There are also additional resources required by GitLab to provide lab infrastructure, support, and certification assessments as the number of attendees in the class increases.

2. What is the process for making an
