

that includes 'success management introduction' in the title.

Program Introduction Resources

A customer-distributable Success Management data sheet as well as an accompanying slide presentation are available for use to guide the customer discussion. These resources are only available to GitLab team members.

OpenShift FAQ

FAQ for customer engagements when customers are using OpenShift

Q: How will the customer use GitLab with OpenShift?

A: When working with a potential prospect it's important to understand how that customer wishes to use GitLab and OpenShift together. Will the customer just deploy projects from GitLab to OpenShift? Does the customer wish to run a GitLab Runner within OpenShift? Or, does the customer need to run the GitLab Server within OpenShift? Knowing the answer to this is key before continuing the architecture conversation because GitLab currently can deploy to OpenShift, can run runners within OpenShift and run the GitLab server within OpenShift.

Q: What is the planned release date for OpenShift integration?

A: The GitLab Server Operator (the ability to run a GitLab instance on OpenShift) was released with GitLab v14.3. The GitLab Runner Operator was already released previous to v14.3.

Q: What features currently do not work when running GitLab with OpenShift?

A: SAST, DAST, AutoDevOps. These are on the roadmap with no designated date as of yet.

Q: What OpenShift versions will the integration work with?

A: OpenShift versions 4.5 through 4.8 are currently supported. Version 4.9 support is in the works. Versions 3.x and below will not be supported.

Q: How can I (or my customer) track the integration status?

A: See this GitLab Epic

Campus Program Technical Evaluation Playbook

The GitLab for Campuses program introduced flat rate pricing for universities based on size. In order for these campuses to evaluate GitLab's fit for their schools, labs, and students, a campus technical evaluation playbook was created. The playbook covers personas, meeting types, options and outcomes associated with an ideal 4 to 8 week evaluation of GitLab for campuses with minimal to moderate knowledge of GitLab.

Solutions Architects can use this playbook to guide campuses through an evaluation of GitLab's broad technical capabilities. The playbook is accessible by GitLab team members only.

- What we do - Information about what tasks and activities renewals managers perform.

Renewals Managers --> visit the internal handbook page and Highspot for more information.

Execution: Establishing fundamental excellence

Renewals managers (RMs) execute a series of activities across a specifically defined customer renewal lifecycle. These activities are both internal and customer facing. We seek excellence in performing the fundamental tasks of renewals management.

Renewals lifecycle

The renewals team organizes it's coverage of a customer subscriptions around particular key stages during a customers journey through the renewal process. During each stage we prescribe specific activities that encourage renewals managers to deliver distinct, stage relevant customer outcomes.

Time Frame	Renewals Stage	Customer Outcomes (Qualitative)
Month 1	1. Deploy	Customer welcomed/back, environment set-up/affirmed, startup issues identified/triaged, licenses utilized
Month 2	2. Activate	The majority of licenses are being utilized, customer is enabled to enter the adopt stage
Month 3,4,5,6	3. Adopt	Customers encouraged to optimize platform, early risk signals identified/mitigated, subscriptions show high utilization
Month 7	4. Advocate	Customers identifying expansion opportunities, verbalizing advocacy
Month 8,9	5. Expand	Customers have evaluated needs for more subs, up-tiering
Month 9,10	6. Prepare	Comfortable and starting the commercial portion of the renewal lifecycle
Month 11	7. Quoted	Timely access to an accurate quote

Month 12	8. Signing	Signatures on quote, PO raised/sent (when necessary)
Month 12	9. Closed Won	Entitled, shown gratitude, and equipped for day zero success

Renewals policies

To build and maintain an efficient, fair, and high impact renewals organization, we have adopted the following policies and processes to describe our engagement with field sales, partners and customers.

Rules of engagement

- Growth opportunities
 - First order business is handled by Account Executives
 - Customer add-ons are identified by Renewals Managers, and primarily managed by Account Executives (exceptions made for timing risk to customers environment; risk to experience)
 - Connected-new opportunities are handled by Account Executive
- Renewal opportunities
 - Customer true-ups are handled by Renewal Manager
 - Renewals Managers do not waive true-ups
- Channel opportunities
 - We respect the incumbency of partners unless a lack of action by the partner puts a customers environment at risk
- Opportunity Coverage
 - Renewals managers primary focus is managing renewal ATR ; coverage for new business and add-on's growth NetARR should default to the account executives team

Late renewals management

Our management philosophy regarding the expectations of booking renewals is simple - always timely and always accurate.

- Timely:
 - It is expected that a renewal opportunity be closed-won or closed-lost by the subscription renewal date.
 - We close-lost opportunities when we have full confidence that the customers will not renew (we don't use sales automation to close opportunities)
- Accurate:
 - No pushing: We do not manipulate the close date to influence personal performance metrics (i.e. pushing churning opportunities into the next quarter/year)
 - No detrimental pulling: We do not pull opportunities forward into quarters for the purpose of personal performance metric effect if it results in compression (i.e. offering a discount for an early contract reset to improve a quarters performance)
 - Corresponding subscriptions: We book opportunities that correspond, together (aka SaaS and Self-Managed migrations are booked at the same time)

Compensation

Churn Exceptions

- Churn exceptions are possible, but not guaranteed. Each circumstance will be considered independently. Some common scenarios considered for churn exceptions are:

1. Misrepresented or temporary Churn/Contraction

- a. Near-term add-on contraction (true up negotiations, budget optimizations)
- b. Subscription migration and consolidations - where we can prove that users simply moved to another subscription (not-merged) on another opportunity, or to another account
- c. System errors (non-standard contract resets that may net incorrectly, incorrectly merged opps)

1. Strategic Churn/Contraction

- a. Change in GTM (direct to indirect) and the associated margin event that results in contraction

- b. Change in term length (must pass approvals)

1. Protected Churn/Contraction

- a. Large/Influential Tier 3 deals where a churn event encompasses more than 10% of a Renewals Managers overall quarterly target may be considered

- b. Recent account transition churn/contraction - opps that have been recently acquired as a result of account transition

- Timing: Have all exceptions submitted by the first two days of the new quarter.

- Threshold: Consider the amount of churn/contraction - small renewals in these scenarios should be balanced with the amount of effort to find/submit them (i.e. submitting a 200 dollar opp may take more time than it's worth)

- Submission

- Here are the steps to request a review of your churn exception:

1. From the Opportunity you are seeking an exception, select the "Request Support" button and enter the following information:

2. Team: Renewal Ops

3. Request Type: Churn Exception Request

4. Migrated Opportunity: The "new" opportunity where the ATR was transferred or that helps justify the exception request

5. Exception Request ARR: How much ARR are you requesting as exempt?

6. Justification: Please provide any information on why you are seeking an exemption

7. After you have entered the above information, select Submit Case.

8. Follow the link to your new case and using Chatter, mention your manager for approval.

-Checking the Approval Status

- Once you have submitted the Exception Request, Renewal Ops will put the status as "Work in Progress".

- Exceptions will be reviewed on the first business day of the next month. For example, a churn exemption that was submitted in February and had a close date in February will be reviewed on March 1.

- If the "new" opportunity where the justification was provided is not Closed Won, we will change the status to "In Progress: Blocked"

- If your request is approved, the boxes "Leadership Approval" and "Compensation Approval" will be checked.

- If your request is not approved, there will be notes in the Ops/Compensation Notes field. We typically also engage via Chatter on the Case. Chatter should not be used on the Opportunity.

- Once all approvals are complete and Sales Comp has been notified, your case will move to Closed.

Metrics

The renewals organization puts a focus on execution through a balanced series of metrics.

Primary Metrics

- Renewal Rate (% of dollar)
[Won ARR Basis (for Clari)] / [ARR Basis (for Clari)]
- On-time renewal rate (% of dollar) (of opps)
Close date >= subscription renewal date
- Lifecycle Activity Completion Rate
Completion Rate >= Lifecycle Tasks Completed/Number of Lifecycle Tasks Assigned

Secondary Metrics

- Growth NetARR (%) - everything but first-order business
[Comp] Net ARR (growth)

Tertiary Metrics

- Opportunity health: Next steps completion, stage progression, activity execution
- Under management: \$ and opps in each tier (0,1,2,3)
- Compression: Average discount
- Scaling: % of business executed through partners
- Closing Velocity: Average quote to close time (measured by stage progression)
- Customer Satisfication: NPS, CSat scores

SECTION: customer-success/renewals-managers/rm-onboarding.md

Renewals Manager (RM) Onboarding Journey

Welcome to GitLab! We are happy to have you join as a Renewals Manager (RM). This handbook page will provide you with an overview of what you can expect during onboarding journey including learning objectives, milestones, and ways in which your manager and onboarding buddy will be supporting you during this time.

Overview of Role-Based RM Onboarding

As a RM, your onboarding experience will be a blended learning experience that includes virtual synchronous meetings, a self paced role-based learning path on GitLab University, and a hands-on virtual workshop called Sales Quick Start (SQS).

Your role-based learning path is highlighted in this role-specific onboarding guide. Please make a copy of this document and check off items as you complete them.

Learning Objectives for RM Onboarding

As a RM, in addition to the SQS learning objectives, your onboarding is intended to fulfill the following learning objectives:

Module 1 - Renewals Manager Basics

- Demonstrate understanding of GitLab Basics
- Understand the mission and vision of the Global Renewals Organization
- Express understanding of the Global Renewals Organization
- Schedule calls to shadow fellow RM team members

Module 2 - Renewals Manager at GitLab

- Demonstrate understanding of roles and responsibilities of RMs at GitLab

Module 3 - Rules of Engagement

- Demonstrate understanding of renewals policies including rules of engagement and late renewals management
- Demonstrate ability to create and manage opportunities

Module 4 - Deep Dive

- Demonstrate understanding of how to utilize tool stack for your role
- Identify which tools to use in different stages
- Understand how a RM collaborates with other account team members
- Understanding the Renewals lifecycle

Module 5 - RM Onboarding Conclusion

- Complete Sales Quick Start (SQS) prework
- Discuss customer readiness with your manager
- Complete role-based onboarding learning path

Milestones and Onboarding Roadmap

RM Onboarding Journey Roadmap

Expectations for Manager support during onboarding

Your manager will be there to support you during your onboarding journey. Beyond the expectations laid out for your manager in your onboarding issue, they will be providing you with the following support:

Month 1

- Schedule recurring 1:1 calls
- Provide guidance on who the new hire should schedule coffee chats with during their onboarding journey
- Review and discuss company policies such as the PTO policy, family and friends first culture, and GitLab's CREDIT values

- Discuss any team specific expectations
- Review organizational structure
- Ensure your new team member has access to all role-specific tools and appropriate Slack channels
- Align on a general plan to get customer ready and schedule role play activities
- Ensure your new team member is meeting appropriate milestones and expectations from week to week
- Identify skills to be mastered and resources available to accomplish learning objectives

Month 2

- Discuss any general concerns or challenges your new team member might be experiencing
- Discuss any challenges your new team member is experiencing with asynchronous culture
- Share constructive feedback on role plays that should have been completed as part of their onboarding experience
- Ensure onboarding milestones are met and that new team member is completing all the requirements
- Align on whether your new team member is on track to be customer ready (if not already meeting with customers) and provide them with additional support as needed
- Discuss best practices for RMs

Month 3

- Decide on a regular cadence for 1:1 calls
- Consider shadowing some customer calls and provide feedback as needed
- Confirm that new team member has completed all mandatory and necessary onboarding activities including SQS and role-based learning path
- Discuss how their performance will be formally evaluated in the future

Beyond 3 Months

- Provide regular feedback on performance
- Encourage your new team member to develop an individual growth plan for their long term goals

Expectations for Buddy support during onboarding

Month 1

- Nurture a welcoming environment for the new team member
- Establish a recurring 1:1 meeting to check in on the new team member's progress on onboarding activities
- Provide assistance or support with any barriers or difficulty understanding concepts covered in the onboarding learning path and SQS
- Connect the new team members with the broader team to build a network
- Share helpful tips and resources that are beneficial during their onboarding and beyond

Month 2

- Provide opportunities for the new team member to shadow you on calls; debrief on calls and discuss any feedback

- Align with new team member's manager on other ways you can provide support

Month 3

- Provide support and feedback as it relates to different customer situations and discuss mitigation strategies for renewals
- Inform new team member on how you can support them beyond their onboarding journey

Graduation from RM onboarding

In order to be considered as having "graduated" from onboarding as a RM, you need to have completed the following:

- Completed items capture in the checklist of your GitLab onboarding issue (it is recommended that you have this completed in 5 working days from your start date)
- Completed Sales Quick Start (SQS) prework on GitLab University
- Attended the SQS workshop and completed all relevant activities
- Completed your role based learning path on GitLab University (it is recommended that you have this completed in 10 working days from your start date)
- Completed role play activities and discussed feedback with your manager / onboarding buddy
- Shadowed at least 5 - 10+ calls as determined by your hiring manager
- Be proficient in all SFDC operations as it relates to your role as a RM which includes preparing accurate renewal quotes to customers or resellers
- Be proficient in sales order processes
- Demonstrated a clear understanding of how to effectively use the GitLab handbook as a resource
- Demonstrated an understanding of forecasting

It is expected that by your 20th working day, you will be assigned to your territory.

Continuous Enablement

In addition to onboarding enablement, continuous enablement will be available to you via micro-learning, job aids, just-in-time learning, and webinars.

- Customer Success Skills Exchange is a biweekly webinar for the Customer Success and Solutions Architect teams on various topics
- Field Enablement Spotlight sessions take place weekly and cover topics relevant to the field
- RM Highspot Page serves as a single source of truth for RM content

Feedback

Your feedback on the onboarding process is important to us and we welcome your thoughts and ideas about how we can improve in the future. Please share your feedback in the following issue: RM Onboarding Feedback.

- How We Do It - Information about how renewals managers execute on the mission.

Renewals Managers --> visit the internal handbook page for more information.

FY25 Renewals Opportunity Management

In FY25, the Global Renewals team will manage more customer-facing transactions than any other team at GitLab. As such, the Renewals team manages Renewal Opportunities with the utmost level of rigor and data quality to ensure a high degree of organization, effective collaboration with account teams, and successful Renewal outcomes.

The Renewals team primarily uses these key fields on Renewal Opportunities:

Opportunity Info

- Close Date - The date on which this Opportunity is expected to close (if still open), or the date on which it closed.
- Subscription Renewal Date - the Renewal Date of the active Subscription
- Customer Subscription link - hyperlink to the Subscription information
- Type - indicates whether the Opportunity is New Business, Add-on, or Renewal
- Order Type - Indicates whether this Opportunity counts as new, growth, contraction, or churn.
- Auto Renew Status - indicates if the Subscription is set to automatically renew or not

Deal Management

- Stage link- indicates where in the Renewal/Sales cycle the deal is
- Renewal Manager Next Steps - field to record critical information and actions that have occurred during the deal lifecycle and what and when the next step is to progress the deal forward
- Renewal Manager Notes - field to capture running notes specific to the Renewals Manager

Forecasting

- Renewal Forecast Health link - Red, Yellow, Green health rating based on the Net ARR field
- Renewal Risk Category - used to categorize the magnitude of risk on a Renewal and if the risk is Actionable

- ATR - the revenue that is Available to Renew (ATR)
- Amount - the forecasted revenue for the deal
- Renewal Swing ARR - the revenue the Account team believes can be saved on an at-risk Renewal if we take action
- Net ARR - the delta between the ATR and the Amount. Positive NetARR reflects Growth while negative NetARR reflects Churn or Contraction.
- ATR - Used for calculating Renewal Rate. This is the revenue that is Available to Renew (ATR)
- Won ATR - Used for calculating Renewal Rate. This is the forecasted renewal revenue for the deal. This field caps out at 100% of the ATR field to reflect no more than a 100% renewal.
- Active Mitigation - Used to describe the primary mitigation if the opportunity is at risk
- (Best Case / Most Likely / Commit) Forecasted Churn - Describe the best case, most likely and worst case (committ) scenarios. Best Case and Commit are calculated fields that are dependent on other risk forecasting fields. ML is a manually entered field that should describe what the renewal manager believes is the most likely amount of churn or contraction.
- Renewal Manager Notes - A field often populated with a template that describes risk reason, customer brief, intervention in process notes, and intervention required observations.

Ownership

- Opportunity Owner - the DRI for the outcome of the Opportunity
- Renewals Manager - the Renewals Manager supporting this Opportunity
- Carahsoft Renewals Manager - indicates the Carahsoft Renewals Manager supporting this deal

Analytics

- Closed Won Reason - the reason the deal was Closed Won
- Risk/Loss Reason Category - the reason the deal was Closed Lost or the cause of contraction on an opportunity
- Risk/Loss Reason Sub Category - additional details on why there was contraction or the opportunity was lost
- Closed Won Details - free-form field for additional information and insight as to why we won the deal
- Closed Lost Details - free-form field for additional information and insight as to why we lost the deal
- Downgrade Details - free-form field for additional information and insight as to why the customer reduced.

Renewals Forecast Methodology

In FY25 The Global Renewals team is responsible for providing the business with a renewal rate and churn forecast on a regular basis for the Enterprise-Growth (ENTG) and Commercial (COMM) Segment.

Providing an accurate, data driven forecast is essential for GitLab's continued growth as it enables the business to:

- Identify and manage Churn and Contraction risk effectively
- Drive revenue predictability in support of strategic decision making
- Analyze and take strategic action on trends within GitLab's book of business to mitigate risk

Approach

In partnership with AEs, the Renewals team will generate a "bottom-up" renewal rate and churn forecast whereby every ENTG and COMM Renewal Opportunity will contain a forecasted revenue range to predict the outcome or potential outcomes of the Renewal. With every Renewal Opportunity forecasting a "worst case" and a "best case" scenario Renewals Managers will be able to provide a forecast range for their worst case renewal rate and their best case renewal rate for a given time period, territory etc. As risk is identified, categorized, and forecasted, Renewals Managers will alert relevant parties (CSM, AE) using appropriate channels.

Key Renewal Forecasting Fields

The key risk fields for capturing risk on the renewal are:

- Renewal Risk Category with the following selections:

- Will Renew: Used when we have full confidence the customer will renew all the revenue Available to Renew (ATR)

- Will Churn: Only used when we have 100% confidence the opportunity will fully churn (rarely used, most cases are not 100%).

- Example: Customer has gone out of business or the U.S. has placed trade sanctions on a country where we do business.

- Will Churn (actionable): Used when the entire opp is at risk, but steps can be taken to mitigate that risk

- Examples: Competitive bidding situation, customer has indicated they are pursuing other alternatives, we believe given the right audience and the right executive involvement we can influence that decision.

- Will Contract: Used when we have 100% confidence that there will be a reduction in seats on the subscription or a downtier (rarely used)

- Examples: Significant workforce reduction at a customer that reduces the number of engineers capable of using the GitLab platform to well below their current seat count (including appropriate buffer levels).

- Will Contract (actionable): Used when there is a risk to a portion of the renewal opportunity, but steps can be taken to mitigate that risk, fully or partially.

- Examples: Customer has indicated they are evaluating downtiering to premium - we believe with a SA-led VSA we can demonstrate the value and cost savings associated with the Ultimate version, and influence that decision.

Criteria for how to assign risk (pre and post-quote)

- Pre-quote

- For Will Churn (actionable) or Will Contract (actionable)

1. Fill in the Amount field with the annual value that is expected to renew (i.e. how much we predict will actually book). The Renewal Forecast Health field will automatically update to Red if the Amount is less than the ATR.

2. Fill in the Renewal ARR Swing amount with how much of the churn/contraction may be saved with intervention. (Note the Renewal Swing ARR must be a positive number and not greater in magnitude than the Forecasted Churn. Ex. if Forecasted Churn is -\$100k the Renewal Swing ARR

cannot be greater than +\$100k)

3. Record your Next Steps

4. Record the risk intervention idea/ask/motion in the Renewal Manager Notes section (you can use the risk intervention table for ideas)

For the other two categories - Will Churn and Will Contract - use same steps, but no Renewal ARR Swing field is needed

- Post-quote

- For Will Churn (actionable)

1. Turn the Renewal Forecast Health field Red and check the Renewal Forecast Health Override box. (Note that checking this box with Red will automatically set Won ATR to \$0)

2. Fill in the Renewal ARR Swing field

- For Will Contract (actionable)

1. Ensure the primary quote is showing the most conservative (or Commit) renewal outcome. A placeholder or "dummy" quote may be required to forecast the most conservative outcome. If the primary quote reflects Contraction the Renewal Forecast Health will automatically indicate Red.

2. Update the Renewal Swing ARR field

In instances where Sales has a primary quote that reflects Net ARR Growth but Renewals is aware of persisting Contraction risk update the Renewal Forecast Health to Red and check the Renewal Forecast Health Override box. Note that this will set the Won ATR field to \$0.

Both the Will Churn and Will Contract selections should only occur very close to the Subscription Renewal Date - as situations at a customer may change rapidly. These selections indicate that the risk on the opportunity will no longer be actively mitigated.

All Will Churn renewals should be closed-lost by their Subscription Renewal Date

Forecasting Goal

- Maintain two full quarters of forecasted risk (by the end of Q1, Q2 and Q3 should be forecasted)

Risk Intervention Tactics

These tactics/motions may not always be approved or appropriate for each risk scenario, but they can serve as a starter and repository for ways in which Renewals Managers may intervene in renewal risk situations.

1. Executive involvement - email
2. Executive involvement - call w/ decision makers
3. Discounted professional services
4. CSM/E workshop
5. Discount/rebate on specific renewal
6. Offer better contract terms (Net 60, etc)
7. Product team - features preview
8. Favorable ramp deal

9. SA VSA engagement
10. Peer phone call (peer of customer)
11. Board member contact
12. Develop bespoke ROI deck for customer internal justifications

Kicking off the risk mitigation (end-to-end summary)

1. Allocate the current risk to the opportunity (pre-quote using the Amount field, post-quote using the quote)
2. Categorize the risk using the Risk Renewal Category and Renewal Forecast Health field (always red if the opp is at risk)
3. Describe the impact of a successful intervention in the Renewal Swing ARR field
4. Articulate the intervention being actioned/requested in the Renewal Manager Notes field using the following syntax:

- Date: The date of your update

- Current Risk Status: Why the oppity is at risk?

- Customer Brief: What do we know about the customer's position and sentiment toward the renewal?

- LT Intervention in Process: What intervention tactic is currently in progress, if none, mark N/A.

- LT Intervention Needed: What intervention tactic is needed, mark N/A if one is "in process" and outlined in the above note.

5. Update the Renewal Manager Notes section with one or more of the following hashtags to demonstrate the appropriate status

- A. [UserMigration] - demonstrates C&C in a scenario where actual revenue is not leaving the company but rather being shifted to another opportunity (RM needs to document the opportunity where the revenue is captured by including the link in manager notes in accompaniment of the hashtag)

- B. [Risk] - leverage when the renewal opportunity should be on a "watch-list" but the risk is not vetted enough to be reflected in the forecasting fields. Also can be used to describe contraction risk when we cannot match the risk with the quote.

- C. [DeferredChurn] - leverage on renewal opportunities where a negative impact to renewal rate and/or arr basis occurred due to activity outside of standard practices. Example 1, we waive a true-up {at renewal prep stage} and add on the users, increasing the arr basis spend knowing the customer will likely decrease seat count at the next renewal. Example 2, we have two opportunities that are related due to a migration project and close win the opportunity with the nARR attached to it at the end of the quarter and wait to close loss the opportunity with negative arr in the new quarter.

- D. [RiskMitigated] - leverage to represent the journey of moving a renewal opportunity to Red back to Green via mitigation efforts. A brief outline of events displaying the journey/mitigation efforts should be documented when using this hashtag.

6. Review and prioritize interventions in your scheduled forecasting calls with the management team.

7. Kick off the intervention in chatter using this example format:

- [Risk Intervention] (Executive involvement - EXECNAME email, in the next 2 weeks) Hi EXECNAME - our customer is a huge fan of your work and I think an email from you would be impactful in mitigating the risk we are seeing on this opp. Here's a doc with language and context. @EXECNAME, CC: @MANAGER

- [Risk Intervention] (CSM/E Workshop - premium feature demo, next week) Hi CSMName, if we can demonstrate the efficacy of premium features for this customer we have a chance to save this opp. I've kicked off a triage issue to manage the workshop - here's the link. @CSMName CC: @MANAGER

Quantifying the risk to an opportunity

The following detail different opportunities and our standard approach to quantifying/labeling the risk and swing fields.

1. Customer Unresponsive --> Will Churn (actionable) with a full Renewal Swing ARR field (full amount of recoverable)
2. Signed Quote for contraction but waiting on PO --> Will Contract
3. Competitive bidding situation --> Will Churn (actionable) with a full Renewal Swing ARR field (full amount of recoverable)
4. Early stage risk (underdeployment in the deploy, activate, adopt phases) --> Will Contract (actionable) with the underdeployed percentage shown as risk on the Amount field, and the Renewal Swing ARR field showing the underdeployed amount as influenceable.
5. Procurement risk (new BPA w/ mandatory discounting, customer is using third-party vendor) --> Will Contract (actionable) with the new mandatory or expected discount on the Amount field (pre-quote), and the Renewal Swing ARR field showing the discount value as actionable.
6. Program/project termination - Will Churn (actionable) with a full Renewal Swing ARR field (full amount of recoverable)

Key fields for calculations of the forecast

The key revenue fields for setting the Renewal forecast are:

- ATR
- Amount
- Won ATR
- Renewal Swing ARR

The ATR field is the amount of revenue that is up Available to Renew (ATR). The Won ATR is the field we use to indicate how much of the ATR we believe will be renewed on a given Subscription. This field is populated based on the revenue input in the Amount field.

By comparing the Won ATR field to the ATR field we can determine a forecasted renewal rate with the following formula:

$$(\text{Won ATR} / \text{ATR}) \times 100 = \text{Worst Case Renewal Rate}$$

For example, if we have a renewal with \$100k in the ATR field, that means we have a Subscription with \$100k of ARR to renew. Based on their analysis, a Renewals Manager predicts that, as a worst-case scenario, we will renew \$75k out of the \$100k, and the Customer will Contract by \$25k. The Renewals Manager will input \$75k in the Amount field (which populates the

Won ATR field with \$75k). Based on the above formula, we arrive at a 75% Renewal Rate for this deal as a worst-case scenario.

$$(\$75,000/\$100,000)100 = 75\%$$

The next step is to determine our potential best-case scenario. We achieve this by using the Renewal Swing ARR field and adding that value to the Won ATR field value. The formula looks like this:

plaintext

$$(\text{Won ATR} + \text{Renewal Swing ARR} / \text{ATR}) \ 100 = \text{Best Case Renewal Rate}$$

Building on the above example, the Renewals Manager determines that if we take action, we could save the \$25k of revenue that is at risk. To reflect this in the forecast, the Renewals Manager updates the Renewal Swing ARR field with \$25k so that our best-case Renewal Rate looks like this:

plaintext

$$(\$75,000 + \$25,000/\$100,000)100 = 100\%$$

What the Renewals Manager is saying with this forecast is that the worst-case scenario is a 75% Renewal Rate, and the best-case scenario is a 100% Renewal Rate.

In summary, the Renewals Manager is forecasting that they believe there is a risk the Customer reduces their Subscription from \$100k to \$75k (\$25k Contraction), but if we take action, they could get the Customer to renew all \$100k of their Subscription (no Contraction).

Note that if there is no risk on a given Renewal, the worst-case scenario and best-case scenario will be the same (a 100% renewal), and populating the Renewal Swing ARR field is not necessary.

Account team collaboration

Renewals Managers work closely with Customer Success Managers/Engineers and Account Executives. After a customer purchases a subscription with GitLab - they can expect to be engaged by these persona in the following ways:

- Account Executive: Manages the overarching customer relationship with GitLab on the account level. Primary focus is on how to grow the customers relationship with GitLab. Account Executives are sales people. Best practice - CC the CSM/AE on the account when in communication with customer.
- Customer Success Manager/Engineer: Dependent upon our segmentation, a CSM or CSE could be assigned to an account or territory. Their primary focus is adoption, outcomes and advocacy. CSM/Es are not sales people - they are specialists in Customer Success. Best practice - CC the CSM/AE on the account when in communication with customer.
- Renewals Manager: Manages a customers existing renewable business. Primary focus is on retention, with a secondary focus on growth. Renewals managers are a hybrid role - managing the renewal "sale" and the renewal process. They sit at the intersection of customer success and

sales.

SECTION: customer-success/renewals-managers/home/index.md

Global Renewals Organization

The Global Renewals Organization is part of the GitLab Customer Success function. We partner with Customer Success, field sales, our ecosystem of partners, support and marketing organizations to deliver maximum value to GitLab customers throughout their subscription lifecycle.

The Global Renewals Organization is made up of renewals managers. A renewals manager looks after a customer's entire existing book of renewable business and manages those renewal opportunities in Salesforce from inception (day one after a new sale) to renewal booking. A renewals manager is aligned to a territory and supports customers within that territory by working in coordination with an account team (typically made up of a Customer Success Manager/Engineer, a Solutions Architect, and an Account Executive).

The Global Renewals Organization is divided into four geographic areas of coverage:

- APAC: Slack channel --> [apac-renewals-mgr] (private, internal only)
- EMEA: Slack channel --> [emea-renewals-mgr] (private, internal only)
- Public Sector (USA only): Slack channel --> [pubsec-renewals-mgr] (private, internal only)
- Americas: Slack channel --> [amer-renewals-mgr] (private, internal only)

Other ways to reach members of the Global Renewals Organization include:

- Global renewals manager slack channel --> [global-renewals-managers] (public, world-wide team channel used for best practices, questions, updates)
- Global renewals leadership slack channel: [global-renewals-leadership] (private, managers wide channel used for updates, questions, best practices)
- Global renewals organization feedback channel: [renewals-org-ideas-and-feedback] (public, world-wide feedback channel)

Mission Statement

To maintain the highest renewal rate in the DevSecOps industry.

Vision

To be the defining subscription renewals organization among peers in the SaaS industry.

Values

- Customer first

The renewals team exists to service the needs of our customers. We prioritize what's best for the customer before what's best for GitLab.

- Collaboration always

As much as possible, we emphasize team goals over individual achievement.

- Continuous improvement

The renewals organization is dedicated to developing a community of renewals scientists that seek to identify process waste and poor customer experience to develop practices for improvement.

Strategy

Our strategy defines how we win in the market we have chosen to compete. It is not timebound - simply a series of declarative statements about the competitive advantages we seek and the systems that will deliver those advantages.

Market

Enterprise and Growth sales segments, with a focus on customers that are under full renewals lifecycle management.

How we win

1. More impactful customer engagement via a thoughtfully architected and executed subscription lifecycle
2. More efficient and effective renewal operations
3. A better customer renewal experience driven by a culture of small, incremental continuous improvements
4. An empowering team culture

RM New Team Member Onboarding

As a Renewals Manager (RM), your onboarding experience will be a blended learning experience that includes virtual synchronous meetings, a self-paced role-based learning path on GitLab University, and a hands-on virtual workshop called Sales Quick Start (SQS). Your role based learning path is highlighted in this role-specific onboarding guide. Please make a copy of this document and check off items as you complete them.

SECTION: customer-success/success-services/_index.md

The Success Tier offerings are part of the Customer Success function that represent enhanced partnership options for our customers to deliver value and positive business outcomes throughout their journey with GitLab.

The Success Tier team can be reached in Slack channel (internal only).

For content for positioning the value of the tiers, how to price/quote the tiers and how to handle objections, please visit the internal handbook page Success Services (aka Success Plan Services).

Success Tiers

Overview

Our Success Tiers drive adoption and value realization of GitLab products whilst providing customers with Best Practices and a higher tier of White Glove support. We achieve this by bundling an Assigned Support Engineer (ASE), Customer Success Architect (CSA)/Customer Success Manager (CSM) and Education services into a single SKU as an annual renewable service.

The Assigned Support Engineer (ASE) is the primary point of contact for their customers and will triage any support ticket logged by that customer and is included with the Signature Tier. Over time, because of this consistent resourcing, the knowledge of the customer's needs, environment and architecture results in faster resolution times to the most common logged issues.

The Customer Success Architect (CSA) is accountable for their customer's success through GitLab product adoption using well understood Best Practices. CSA's bring deeper product knowledge and technical depth than the industries traditional CSM role. With experience across many customers, they are experts at ensuring features are leveraged the right way for maximum value. This customer experience has lead to development of best practice content and prescriptive road-maps. This content is folded into the Success Tiers offerings as "Accelerators".

> Customer Success is not permitted to be "Hands on Keyboard" with customers. We can and do provide best practices, architectural guidance and will tailor adoption and success plans to a specific customer need. If a customer needs GitLab to develop a bespoke solutions or actively change or manage their configuration, we will need to engage our Professional Services team.

Education Services included with Success Tiers encompasses 1 day of Instructor-led Training as well as a significant number of Training Certification Exam vouchers. This enables us to partner the running of specific accelerators, aligned to training and certification, to ensure your team is ready and able to drive the cost benefits that GitLab brings.

Success Tier Customer Onboarding

<i>within first week</i>]

C --> D[Customer Kick-Off Call
<i>within first 1 to 2 weeks</i>]

D --> E[Accelerator Begins]

Note that you may be onboarding an account which is not net new. To ensure smooth collaboration and handover with the account team, it is advised to consult the responsibility matrix issue

Success Tier Customer Onboarding Artifacts

1. Introduction Email

1. This email will be sent within 24hrs of both CSA and ASE resources being identified and as close as possible to Order Form being received from Customer.
2. Utilize the appropriate welcome email template -
 1. Signature | Success Tiers - Welcome Email
 2. Advanced | Success Tiers - Welcome Email
 3. Essentials | Success Tiers - Welcome Email
3. The first priority is getting the kick-off call locked in so that you can review the program and get in front of the customer

Success Tier Customer Onboarding Activities

1. Internal Kick-off Call

1. Internal prep call for the CSA to perform knowledge transfer and coordinate with the account team on what is the priority work to wrap an accelerator around.
2. The purpose of this call is to discuss the customer objectives between the account team and the CSM/A, which should be identified prior to the Order Form being signed.

Account Context & Technical Documentation Template

1. The Template helps standardize the documentation of critical customer information, technical configurations, stakeholders, and strategic objectives gathered during account onboarding to ensure consistent knowledge capture and enable effective handoffs between CS team members.
2. Utilize this internal template and customize to your customer's needs
Tip: you can organize a playback/walkthrough meeting with your account team (SA, CS) to validate your understanding prior to the kick-off call
3. This template should help you structure and play back your understanding of the account to your SA/CS team, creating a foundation for discovery workshops and collaboration projects by capturing key business drivers, technical requirements, and stakeholder priorities in a standardized format that can be easily validated and expanded upon.

2. Customer Kick-off Call

1. This will be scheduled within the first week of the agreement, subject to customer availability.
2. If the customer is not available in the first week for a formal kick-off, both ASE and CSA should begin work asynchronously and will start any needed conversations through email.
3. Utilize the appropriate kick-off deck & customize as needed (internal).
 1. Signature | Success Tiers - Kickoff Deck
Demo
 2. Advanced | Success Tiers - Kickoff Deck
Demo
 3. Essentials | Success Tiers - Kickoff Deck
Demo
4. Share the .pdf version post-call as well as immediate next steps, such as a discovery workshop.

3. Discovery Workshop

1. The outcome of this workshop is to gain an in-depth understanding of the customer's business objectives/success metrics, technology stack, and processes.

2. This is the first step in defining a success plan with the customer as well as identifying a potential accelerator backlog to work on.

3. Tip: Run the discovery workshop within two weeks of the kickoff call to enable triage of accelerator development backlog items and provide feedback to the customer. Leverage this interaction to get a baseline for DORA metrics you will be impacting with your accelerator development.

4. Utilize this intake questionnaire as a starting point. Here is an example of a discovery document created for one of our customers: internal discovery document.

Post Onboarding

CSM Processes

See High-Level Responsibilities of a CSM

CSA Processes

We have CSA specific processes that go above and beyond the CSM role. It is expected that this is layered on top of the CSM processes and responsibilities.

Accelerators

Success Tiers include up to 4 Accelerators for the Signature tier and 2 for Advanced, that your Customer Success Architect (CSA) will deliver.

> An accelerator is a customized form of enablement that a GitLab CSA will define and deliver to a customer. These accelerators span a quarter and they're mapped to your mutual success plan.

An Accelerator, depending on customer requirements and defined outcomes, will pull together one or more of the below content modules. Typically the accelerator runs over 12 weeks. It kicks off with a discovery workshop to document required customer outcomes. From that, we will run a planning workshop outlining with the customer the steps necessary to achieve their outcomes. The output of the Planning Workshop is a backlog of issues logged, in a GitLab project, that includes all the necessary activities that will be managed over the following 10 weeks to achieve those outcomes and close out the Accelerator

Accelerator Content Modules

Category	Content Modules	Description	Outcome
----------	-----------------	-------------	---------

---	---	---	---
-----	-----	-----	-----

CI/CD	Introduction to CI/CD Workshop	The Intro to CI accelerator for the CI Pipeline track is a Getting Started/How to accelerator, focused on building initial familiarity and basic understanding of usage of GitLab CI for users who are new to the platform.	You'll come away understanding the architecture of GitLab ci.yml and GitLab runners, how to create a gitlab-ci.yml, as well as common patterns and rules
-------	--------------------------------	---	--

CI/CD	Runner fleet guidance	A Customer Success accelerator to optimize and manage a GitLab Runner fleet at scale.	Your CSA will walk through a maturity assessment, informational sessions
-------	-----------------------	---	--

and interactive training including|

|CI/CD|Rules and pipeline flow|The Rules & Pipeline Flow accelerator for the CI Pipeline track is an Advanced Concepts accelerator, which covers methods of defining the flow of a pipeline using rules, DAG, parent/child pipelines, and any other optimization methods to control the operations of pipelines.|Training that is delivered with best practices|

|CI/CD|CI templates and reusability|The Templates & Reusability accelerator for the CI Pipeline track is an Advanced Concepts accelerator, covering the creation and use of CI templates and optimization of the workflow.|Best practices that have been tailored to your level of maturity|

|CI/CD|Product coach|The Product Coach accelerator for the CI Pipeline track is a Deep Dive accelerator, focused on consultative guidance on best practices and pipeline optimization for customer pipelines.|Your CSA will provide a detailed "guidance report" with 20+ categories to optimize your pipeline|

|CI/CD|Pipeline Template Optimization|Provides a structured 12-week program that optimizes CI/CD implementation through the development of standardized, reusable templates tailored to your organization's specific project types, languages, and compliance requirements.|By the end of this accelerator, you'll achieve measurable efficiency gains with developers spending less time implementing pipelines and more time delivering value, improved organization-wide compliance through standardized practices, and a sustainable framework for ongoing pipeline management and governance.|

|Security and Compliance|Intro to security workshop|60 - 90 minute presentation of security concepts, security features, and getting started recommendations|Customer will be appraised of security scanners, vulnerability dashboards, and how to begin using these features|

|Security and Compliance|Hands-on security lab|90 - 120 minute, hands-on lab that you will have access to a gitlab.com sandbox; we provide the code and have prescriptive steps to configure security and compliance features|Customer will come away with actual experience adding security scanners to a pipeline, configuring security policies and compliance frameworks, and how to triage vulnerabilities|

|Security and Compliance|Ultimate Onboarding|This series provides comprehensive guidance on implementing robust security practices, from initial setup exploration through advanced scanning implementation, policy configuration, and vulnerability management strategies tailored to your organization's needs. |By the end of this accelerator, you'll have a fully configured GitLab security framework with optimized scanning capabilities, customized governance policies, and efficient vulnerability management workflows that significantly reduce risk across your development lifecycle.|

|Security and Compliance|Intro to audit, compliance, and separation of duties workshop|60 - 90 minute presentation of audit concepts, compliance and security policy features, and best practices|Your CSA will tailor this content to your needs and maturity; you'll come away with knowledge that'll allow you pass audits, institute consistency across your groups, and recommendations for where to go next|

|Security and Compliance|Security rollout strategy|This content module will provide a complete plan for rolling out security and compliance features; including timelines and milestones that are mutually agreed upon with GitLab's best practices |The result of this content module will be a presentation of the rollout strategy and how it maps to your outcomes and timelines; additionally, the milestones and tasks will be in the collaboration project backlog so that your CSA can continue to guide on the rollout process|

|Security and Compliance|Product Coach - Compliance Framework/Security Policies Audit|The Product Coach accelerator for the Security & Compliance track is a Deep Dive accelerator, focused on consultative guidance on best practices for security policies, developer workflow, and separation of duties|Your CSA will spend weeks learning your existing workflow and then provide a guidance report that will have best practices and recommendations|

|Security and Compliance|Security Policy Rollout Strategy|The Security Policy accelerator for the Security & Compliance track is a multi-quarter program that your CSA will guide you through. The work is broken out into 5 phases: Architecture & Design, Compliance, Audit & Enablement, Dashboards & Integration, and Scaling. |By following our best practices, you'll be able to have a standardized and auditable GitLab instance. Internal material the CSA will leverage.|

|Agile Planning|Intro to GitLab Plan workshop|Overview of GitLab issue management and backlog workflows|Your teams will come away with an understanding of all the backlog planning features, reporting, and best practices|

|Agile Planning|Jira + GitLab workshop|This workshop will detail the options you have when integrating Jira and GitLab|Your CSA will spend time discovering your current needs and setup; then they'll deliver a customized workshop catered to your outcomes|

|AI/ML|AI/ML hands on lab|Bootstrap your developers on all the AI/ML features GitLab has and how to use them|Your team will walk away being familiar with how to invoke all the AI features and suggested usages for them; they will also have access to a gitlab.com sandbox for 3 days to keep experimenting|

|AI| Duo Enterprise Onboarding | This accelerator delivers a comprehensive 12-week program that strategically implements AI-powered development tools across your organization through customized demonstrations, guided adoption strategies, and ongoing expert support tailored to your specific workflows and team structures|By program completion, you'll achieve measurable improvements in development efficiency with active adoption across multiple Duo features, a self-sustaining internal champion network, and quantifiable gains in key metrics including cycle time reduction, code quality improvements, and enhanced security posture.|

|System administration|Upgrade package|This deep dive accelerator will prepare your system administration team for upcoming upgrades|The outcome will be a detailed upgrade plan, a presentation on the deprecations as well as new features you need to be aware of, and a collaboration project to track any and all questions you have leading up to the upgrade|

|System administration|Managing Monorepos & Large Repositories |Addresses performance challenges in oversized repositories through comprehensive optimization of repository structure, Git LFS implementation, and CI/CD pipeline efficiency tailored to your specific environment and developer workflows.|Measurable improvements in repository performance with reduced clone and fetch times, optimized storage utilization, streamlined CI/CD pipeline execution, and sustainable maintenance procedures that enhance overall developer productivity and support continued repository growth.|

|System administration|Optimizing Platform Resiliency |Enhances your GitLab platform's protection against cyber threats through structured implementation of security hardening, backup strategies, incident response planning, and policy controls tailored to your organization's critical digital assets.|By the end of this accelerator, you'll achieve a significantly more resilient GitLab environment with enhanced security monitoring, validated backup and recovery capabilities, documented incident response procedures, and implemented security policy controls that ensure business continuity and protection of your crown jewel repositories.|

Recording Success Tier Timeline Activities in Gainsight

Consistently recording key Success Tier activities in Gainsight is essential to our customer success operations. This documentation ensures that all team members follow standardized procedures when logging customer interactions.

Accurate activity tracking in Gainsight enables:

- Complete visibility into customer engagement history
- Accurate reporting on Success Tier delivery metrics
- Better collaboration across teams working with the same customer
- Data-driven insights to improve our Success Tier offerings
- Continuity of service during team member transitions

By following these guidelines, we maintain a reliable system of record that supports both operational efficiency and strategic decision-making.

General Instructions (Applies to All Activities)

To record any activity in Gainsight, start by navigating to the customer's account taking you to their C360. Then, depending on the context of the activity:

For activities related to a Call to Action (CTA):

1. Click the Cockpit tab within the account
2. Select the specific CTA to which the activity applies
3. Add the activity from the Timeline tab on the actual CTA to ensure proper association

For activities related to a Success Plan:

1. Click the Success Plan tab in the account navigation
2. Select the relevant Success Plan
3. Click on the Cockpit tab
4. Click on the desired Objective you wish to log an activity
5. On the top-right side, click on the Timeline tab
6. Click Add Activity to relate the entry to the Success Plan

For general activities (not related to a CTA or Success Plan):

1. Click the Create button in the top right corner from anywhere in the account

Specific Activity Types

Kick-off Call

1. Navigate to the correct area in Gainsight as described in the general section above.
2. Once the Activity Timeline Entry form is open, select either Customer Call or In-Person Meeting from the Activity Type dropdown list.
3. Select the Kickoff option in the Meeting Type dropdown list.
4. Fill out the remaining fields with all relevant information.
5. Click Log Activity when finished.

Accelerator

1. Navigate to the correct area in Gainsight as described in the general section above.
2. Once the Activity Timeline Entry form is open, select CSA Engagement from the Activity Type dropdown list.

Note: Any activity logged under this type will be considered an Accelerator.

3. Fill out the remaining fields with all relevant information.

4. Click Log Activity when finished.

Workshop

1. Navigate to the correct area in Gainsight as described in the general section above.
2. Once the Activity Timeline Entry form is open, select Workshop from the Activity Type dropdown list.
3. Fill out the remaining fields with all relevant information.
Important: While not required fields, it's highly recommended to log:
 External Attendees
 Workshop topic
4. Click Log Activity when finished.

Executive Business Review (EBR)

1. Navigate to the correct area in Gainsight as described in the general section above.
2. Once the Activity Timeline Entry form is open, select either Customer Call or In-Person Meeting from the Activity Type dropdown list.
3. Select Executive Business Review from the Meeting Type dropdown list.
4. Fill out the remaining fields with all relevant information.
Important: Complete as many fields as possible, as this information is critical for reporting purposes.

Click Log Activity when finished.

SECTION: customer-success/success-services/accelerator-development/_index.md

For additional accelerator resources, refer to the Accelerator Handbook Homepage.

What is an Accelerator?

An Accelerator is a customized enablement framework defined and delivered by a Customer Success Architect (CSA). Spanning up to a quarter (12 weeks), an Accelerator combines relevant content modules, tools, and best practices to achieve specific customer outcomes. The process begins with a Discovery Workshop to define customer requirements, followed by a Planning Workshop to map out the implementation steps. Key activities are tracked in a GitLab project backlog and executed over 10 weeks, ensuring alignment with mutual success plans.

Important Notes

- Cross-link to delivery projects and assets: Each section of the template includes links to supporting materials to provide a single source of truth.
- Focus on measurable outcomes: Each section emphasizes "What are the outcomes the customer will get?" by defining specific, actionable results tied to business objectives.
- Standardized approach: Ensures consistency across all Accelerators while allowing for flexibility based on customer needs.

- Alignment with success plans: All activities are mapped directly to the customer's mutual success plan to drive tangible results.

Two Dimensions of Accelerator Work

Accelerator work encompasses two distinct dimensions, which are organized under a common group called Success Services:

1. Development of the Accelerator:

Managed by the Customer Success Architect (CSA) team, this dimension focuses on creating structured frameworks, including content, processes, and supporting assets.

- The Accelerator Repository is maintained here to ensure all developed Accelerators are well-documented, scalable, and ready for deployment.

2. Delivery of the Accelerator:

Managed by the Customer Success Architect (CSA) team, this dimension involves implementing the developed Accelerators for customers.

- Activities include structured workshops, guided implementation, and continuous check-ins to ensure Accelerators are tailored to customer needs and deliver measurable outcomes.

This guide and issue template refer strictly to the development of new Accelerators. Use it as a blueprint to ensure the Accelerator is well-documented, actionable, and ready for seamless delivery.

Important links

Group & projects

- Success Services Group
- Accelerator Development Project
- Accelerator Delivery Project

Issue Boards

- Accelerator Development

Value Stream Analytics

Value Stream Analytics (VSA) is the solution for managers and leadership to get actionable insights into the Accelerator development process. VSA allows them to balance out workloads, identify bottlenecks.

- Accelerator Development

Accelerator Repository

The Accelerator Repository is a centralized collection of well-documented, accelerator blueprints (like the AI-Assisted Code Review example), that CSAs can leverage in their own projects.

The Accelerator blueprints contain information that include workshops guides, timelines, prerequisites, implementation steps, expected outcomes, and success metrics.

- Accelerator Development

Accelerator Development Template Walkthrough with Examples

1. Overview Section

This section introduces the purpose of the Accelerator and its high-level benefits.

Example 1: GitLab Performance Optimization

Optimize GitLab instance performance through systematic analysis, monitoring, and targeted improvements to reduce incidents, improve response times, and enhance user satisfaction.

Example 2: Implementing Reusable Pipeline Templates

Accelerate development by creating reusable CI/CD pipeline templates that reduce implementation time and ensure consistency across projects.

2. Customer Impact: Business Value and Outcomes

Clearly articulate the business value and specific outcomes the customer will achieve.

Example 1: GitLab Performance Optimization

- Outcomes:
 - 50% reduction in performance-related incidents.
 - 30% improvement in page load times.
 - Enhanced developer productivity and reduced downtime.

Example 2: Implementing Reusable Pipeline Templates

- Outcomes:
 - 40% reduction in time spent creating new pipelines.
 - Standardized pipeline practices for improved compliance and reliability.
 - Increased developer focus on delivering value rather than configuring pipelines.

3. Technical Benefits & DORA Metrics

Show how the Accelerator improves technical performance with measurable DORA metrics.

Example 1: GitLab Performance Optimization

- Phase 1 (0-3 Months):
 - Deployment Frequency baseline: Weekly · Target: Daily
 - MTTR: 8 hours · Target: 2 hours

Example 2: Implementing Reusable Pipeline Templates

- Phase 1 (0-3 Months):
 - Increase CI/CD component usage from 30% to 60%.
 - Achieve a 95% pipeline success rate.

4. Success Metrics: Measurable Outcomes

Define quantitative and qualitative metrics to measure success.

Example 1: GitLab Performance Optimization

- Quantitative Outcomes:
 - Decrease API response times by 20%.
 - Improve runner utilization efficiency by 15%.
- Qualitative Outcomes:
 - Positive user feedback through surveys.

Example 2: Implementing Reusable Pipeline Templates

- Quantitative Outcomes:
 - 50% of projects using reusable templates.
 - Reduce average pipeline creation time by 2 hours.
- Qualitative Outcomes:
 - Comprehensive documentation for reusable pipeline components.

5. Supporting Data

Include data sources for tracking progress.

- Gainsight Dashboard
- Product Adoption Metrics
- Salesforce Data

6. Deliverables

Define tangible outputs for each phase.

Example 1: GitLab Performance Optimization

- Technical Documentation:
 - Playbooks for performance monitoring.
- Code & Configuration:
 - GitLab Performance Toolkit configurations.

Example 2: Implementing Reusable Pipeline Templates

- Technical Documentation:
 - Guidelines for creating CI/CD templates.
- Code & Configuration:
 - Pre-built pipeline templates for Java and Python projects.

7. Timeline & Resources

Break down the Accelerator into phases.

- Week 1: Discovery Workshop
- Week 2: Planning Workshop
- Weeks 3-12: Implementation & Check-ins

8. Key Milestones

Define critical milestones and deliverables.

Example 1: GitLab Performance Optimization

- Week 1-2: Baseline performance metrics established.
- Week 3-8: Optimizations implemented.

Example 2: Implementing Reusable Pipeline Templates

- Week 1-2: Initial template prototypes developed.
- Week 3-12: Templates implemented and validated.

Labeling for Value Stream Analytics

Proper Labeling in GitLab Projects

Proper labeling accelerator development issues, is critical for ensuring visibility into the progress and success of Accelerators. Labels allow for consistent tracking and reporting across the entire lifecycle
