Apprenticeship for Learning

Typically, an apprenticeship provides an individual with an overview of a position or field over a short period of time. It's surface-level learning geared towards team members who are still exploring their interests and deciding what options they'd like to pursue. If the field of interest, its subject matter experts and the department they want to learn more about can support this effort, then this offers a good opportunity for an internship. For more information on the process please review this handbook section on Internship for Learning.

Eligibility criteria:

- You are excelling in your role (no performance issues)
- You have been working full time with GitLab for at least 6 months

The apprentice agrees to:

- Continue to support their current role and report to their current manager
- Dedicate a pre-determined percentage of their time to the apprenticeship role
- Have clear timelines and deliverables throughout the apprenticeship
- Communicate their assignments and availability clearly to both departments

In return, the department with which they are interning agrees to:

- Provide guidance and support to the apprentice
- Offer meaningful projects for the apprentice to work on
- Be flexible, so that the apprentice can continue to support their primary team and carry an appropriate workload

By default, apprenticeships last for 6 months. At the end of 6 months, both the intern and the department will determine whether it makes sense to extend the timeframe further.

If you wish to apprentice with an Engineering team, start by speaking with your manager.

Important: The Apprenticeship for Learning program should differ from any situations where there is actual temporary or permanent realignment/redeployment/secondment as a result of changing business needs. If you are unsure whether your situation is aligned with the Apprenticeship for learning program or falls into a resources realignment, please discuss with your aligned People Business Partner.

Associates Engineers

Learn more about the career and skill growth support we provide our Associate Engineers [here](#).

As of 2024 this is currently being piloted with the Core Development and Expansion sub-departments.

Senior Engineers

Note that we have a specific section for Senior Engineer because it's an important step in the technical development for every engineer. But "Senior" can optionally be applied to any role here indicating superior performance. However, it's not required to pass through "senior" for roles other than Engineer.

The Senior Engineer role is a critical role where we need the most contributions. It should also be considered a destination role. It is not a given that you will naturally progress into the next role, whether it is Staff or Management. There are different needs and expectations for the next role. Individual growth and progression is supported and encouraged at GitLab, however progression beyond the Senior Engineering role is gated on availability and need. There may not be a need for another Staff or Management position.

Senior engineers typically receive fewer trivial comments on their merge requests. Attention to detail is very important to us. They also receive fewer major comments because they understand the application architecture and select from proven patterns. We also expect senior engineers to come up with simpler solutions to complex problems. Managing complexity is key to their work. Staff and Distinguished positions extend the Senior Engineer role.

Promotion

We strive to set the clearest possible expectations with regard to performance and promotions. Nevertheless, some aspects are qualitative. Examples of attributes that are hard to quantify are communication skills, mentorship ability, accountability, and positive contributions to company culture and the sense of psychological safety on teams. For these attributes we primarily rely on the experience of our managers and the 360 feedback process (especially peer reviews). It's our belief that while a manager provides feedback and opportunities for improvement or development, that it's actually the team that elevates individuals.

Engineering Promotion Rate

People Operations tracks the Promotion Rate for the company overall and each division separately. The target is 15% annually. This metric is treated as an organizational health indicator for the quality of decisioning making our leaders are employing, and for the fairness in our process. In FY21 Engineering was exactly on its target of 12%. So we would not currently consider blocking any individual promotion based on the overall rate. If that were to change, and Engineering became an outlier, we would reevaluate. Here is the company-wide process.

Transfer Options

The following table outlines some of the possible lateral transfer options at any level of the role, but don't feel limited by this table. Compa Ratio might differ per individual to determine leveling for each of the positions listed.

Starting Role	Lateral Options
Frontend Engineer	Product Designer
Product Designer	Frontend Engineer
Backend Engineer	Production Engineer

Production Engineer	Backend Engineer	
Backend Engineer	Support Engineer	
Support Engineer	Backend Engineer	
Support Engineer	Solutions Architect	
Support Engineer	Customer Success Manager	
Support Engineer	Implementation Specialist	
Automation Engineer	Backend Engineer	
Backend Engineer	Automation Engineer	

Lateral transfers among backend teams are also an option. Those teams include Distribution, Create, Verify, Release, Geo, Monitoring, Gitaly, etc.

Team members on loan to another team

A team member may be "on loan" to another team for various reasons. This is less formal and handled differently than interim roles. When this occurs it is recommended to:

- Invite the team member to all Slack channels used by the team. (Don't worry about Slack channel overload. The team member can unsubscribe if they don't find it useful.)
- Invite the team member to any standup activities used by the team. To avoid task overload, the team member can choose to stop participating in their home team standup.
- The manager of the team should schedule weekly 1-1 meetings with the on-loan team member. The team member can choose to stop having weekly 1-1s with their home team manager.

Team members who were on loan to another team documented these best practices in a retrospective.

SECTION: engineering/careers/mentoring.md

Mentoring

Mentoring can be an effective tool in boosting a team member's development. At GitLab we practice formal and informal mentoring and this page will serve as a guide for both. This page includes information regarding the roles and responsibilities of both Mentors and Mentees as well as tips for developing a successful Mentoring relationship.

Mentees

For Mentoring to be successful, Mentees must be prepared to invest time in their own employee development.

Step 1: Evaluate yourself

- Identify your strengths
- Identify your weaknesses
- Reach out to team members and gather feedback regarding what your team members think are your strengths and weakness
- Review previous performance reviews or 360 results

- Reach out to your management and ask for feedback
- Identify future roles you might be interested in
 - For those roles, identify the skills required that you don't currently possess

After performing this activity, decide whether you want to improve upon your strengths, weaknesses or both.

Step 2: Document your goals

Create a list of SMART (Specific, Measurable, Attainable, Relevant, and Time-Bound) goals which will serve as the foundation of the Mentor / Mentee relationship. Create short term goals that can be achieved within a two to three month period. If the goals identified, will take longer, reduce the scope of the goals. It is very important to take an MVC approach to this exercise to make quick and impactful changes. This MVC is now your short term plan that will be used as a guide for your Mentor / Mentee relationship.

Step 3: Execute Your Plan

During this step, your Mentor begins getting more involved. You are the DRI for preparing the Bi-Weekly Meeting Agenda. Your Mentor will support you in identifying actions for you to take to meet your SMART goals. During bi-weekly mentoring sessions the two of you will discuss the best actions for you to take to support your plan. These actions should be specific and measurable and follow the format of SMART goals.

Step 4: Measure and Review

During the bi-weekly mentoring sessions, the Mentor will continue supporting the Mentee by assisting with identifying metrics for your SMART Goals. Discussions regarding the outcomes and results will also occur during these sessions. The Mentor will continue to review the Mentees progress and share experiences and provide anecdotes as the Mentee progresses.

Mentors

Mentors serve as tour guides for the Mentee on their Employee Development journey. They will share their own experiences and provide suggestions and activities that will support the Mentee in meeting their goals. The Mentors will meet bi-weekly for 30 minutes to work with the Mentee giving them advice and consultation to help the Mentee meet their SMART Goals.

Communication

The frequency and method of communication should be agreed upon by both the Mentor and Mentee. The most important form of communication is Google Documents. These two methods of communication are persistent and can often be referred to after the mentoring session or mentoring relationship has ended. Texting, Slack and email are also very useful for planning logistics or for having informal conversations.

Meeting Agenda

The DRI for all Meeting Agendas should be the Mentee. The Mentee should pre-populate the agenda with as much information as possible. Mentors have a very limited amount of time to devote to

this relationship and if the time spent on this effort is predictable and consistent, they will be more likely to engage in future mentoring relationships.

Sample First Meeting Agenda

Agenda

1. Introduction
 - Share personal and professional backgrounds
1. Communications Preferences
 - Identify methods and frequency of Communication
1. Questions
 - Prepared list of questions for your mentor to break the ice
1. SMART Goals
 - Prepared list of SMART Goals

Sample Standard Meeting Agenda

Agenda

1. Last Week's Action Items
 - Review Action Items from the Previous Meeting
1. Discuss new challenges that have arisen unexpectedly
 - Review Mentee progress on
1. SMART Goals
 - Review Mentee progress on
1. Action Items
 - Document Mentee Action Items

Infrastructure Department Career Framework

The Infrastructure Department career tracks are visualized on the Engineering career development landing page.

The Infrastructure Department Career Framework consists of three major components:

1. Company Values Alignment
1. Engineering Function Leadership Competencies
1. Infrastructure Department Leadership and Technical Competencies

Each of these three components are equally important for team member general professional development at GitLab. It is important to note that performance is measured based on general guidelines as defined by the People group.

For each job family, regardless of the level, in the Infrastructure department we are looking to grow team member skills:

- 1. Accountability - Describes expected level of responsibility
- 1. Credibility - Describes expected level of trust
- 1. Autonomy - Describes how a team member can shape their own and their team's work
- 1. Team building - Describes how a team member helps grow their team

The expected team member competencies in the Infrastructure department at GitLab can be seen at the job level:

- 1. Intern
- 1. Associate
- 1. Intermediate
- 1. Senior
- 1. Staff
- 1. Principal
- 1. Distinguished
- 1. Engineering Fellow

Infrastructure specialties

To be added by each individual team as needed.

SECTION: engineering/careers/matrix/infrastructure/associate.md

{{% include "includes/engineering-careers/career-matrix-nav.md" %}}

Associate

Associate-level engineers in Infrastructure are primarily focused on completing tasks and growing their skills in order to contribute to their team's success.

Accountability

- 1. Reliably follows established processes and runbooks, and submits updates to improve them for others.
- 1. Pairs with teammates to plan and make changes in production safely by following runbooks and the Change Management process.

Credibility

- 1. Consistently contributes to team goals by owning assigned work and driving it through to completion.

1. Keeps work visible, and clearly communicates progress and any delays to tasks.
1. Demonstrates consistent growth in best practices and technologies required for their work.
1. Openly shares information about recent tasks to allow for collaboration and support incident investigations.

Autonomy

1. Proactively reaches out to team members or their manager when they need help.
1. Is an effective Manager of One, setting up workflows and workspace to enable effective work.
1. Knows how to find and use the GitLab team tools for various production interactions without necessarily knowing the inner workings of those tools.
1. Seeks to understand how to gain awareness of key aspects of their projects (e.g. impact, communication of the change, required collaboration with other stakeholders, and similar).

Team building

1. Actively participates in team and ad-hoc merge requests to share workload and to grow skills.
1. Contributes to the team culture by actively participating in team-led initiatives, such as: retros, team syncs and demos, discussions and similar.
1. Recognizes interrupts affecting the team throughput, and exposes them regularly to their manager.
1. Supports colleagues who are currently on-call by assisting with investigations or making simple improvements to on-call tooling.

{{% include "includes/engineering-careers/values-competency.md" %}}

SECTION: engineering/careers/matrix/infrastructure/intermediate.md

{{% include "includes/engineering-careers/career-matrix-nav.md" %}}

Intermediate

Intermediate-level engineers in Infrastructure are primarily focused on completing tasks and growing their skills in order to contribute to their team's success.

Accountability

- 1. Participates in the on-call rotations, as defined by their domain requirements.
- 1. Reliably follows established processes and runbooks, and submits updates to improve them for others.
- 1. Makes changes in production safely by following runbooks and the Change Management process. Asks for support from teammates as necessary given the task complexity.
- 1. Understands how their work impacts the availability, performance, and operational overhead for GitLab.com.

Credibility

- 1. Consistently contributes to team goals by picking up issues and owning them through to completion.
- 1. Keeps work visible, and clearly communicates how interrupt-driven tasks will affect timelines.
- 1. Demonstrates consistent growth in best practices and technologies required for their work.
- 1. Openly shares information about recent tasks to allow for collaboration and support incident investigations.

Autonomy

- 1. Proactively reaches out to team members or their manager when they need help.
- 1. Is an effective Manager of One, setting up workflows and workspace to enable effective work.
- 1. Independently provides well-reasoned design options, and works with team members to assess and select the best option. Advocates for dogfooding whenever possible.
- 1. Regularly makes decisions and takes action to improve the team and self.
- 1. Knows how to find and use the GitLab team tools for various production interactions without necessarily knowing the inner workings of those tools.
- 1. Demonstrates awareness of key aspects of their projects (e.g. impact, communication of the change, required collaboration with other stakeholders, and similar). Works with team members to effectively plan and estimate timelines.

Team building

- 1. Actively participates in team requests and ad-hoc tasks such as merge, readiness, incident and change request reviews to share workload and to grow skills.
- 1. Contributes to the team culture by actively participating in team-led initiatives, such as: retros, team syncs and demos, discussions and similar.
- 1. Completes required interview training and learns how to provide support to hiring managers for hiring and onboarding processes.
- 1. Recognizes interrupts affecting the team throughput, and exposes them regularly to their manager.
- 1. Supports colleagues who are currently on-call by assisting with investigations or making simple improvements to on-call tooling.

SECTION: engineering/careers/matrix/infrastructure/principal.md

{{% include "includes/engineering-careers/career-matrix-nav.md" %}}

Principal

Principal-level engineers in infrastructure are significantly driving the department's results and culture by supporting teams at the same time as helping set and align on future group direction. Principal engineers are seen as a partner of their group's Senior Engineering Manager or Director. Together, they are expected to balance the day-to-day details needed to guide and unblock individual teams with a longer term view needed to set the group of teams up for future success. Principal engineers are primarily focused on making an impact on a group of teams but work across the entire company to maintain relationships and share information.

We recognize the four staff engineer archetypes and believe that each of these types can grow into a Principal-level engineer. They will index more highly on certain activities than others, but the intention for the Principal engineer to act at the group level with a strategic focus remains the same.

Accountability

1. Takes responsibility for the group's standards and processes and actively leads cross-team improvements.
1. Keeps up to date on the direction of the department and connects the group to this direction. Works closely with EMs and PMs to ensure individual team technical direction is connected to the department direction.
1. Maintains awareness of company, department and group goals and uses them to decide when to go deep on a topic and when to stay shallow.
1. Represents the group across the company through their own behaviour, and by connecting group direction to other relevant teams. Actively looks for opportunities to connect engineers and engineering goals to their group's teams and goals.
1. Recognises, surfaces, and actively seeks to resolve team friction or misalignments and removes blockers that could impact the group or department.
1. Takes responsibility for the group's impact on availability, performance, and operational

overhead.

1. Helps maintain awareness and health of department performance indicators and helps team's connect their team metrics to the department targets.

Credibility

1. Collaboratively leads the group's technical direction, making use of GitLab features and the team's technical experience to maintain a visible path that connects teams to the department direction. Actively invites feedback to generate the best possible solution.
1. Significantly contributes to company success by proposing practical group objectives that are pragmatic and move towards the company direction. Works with teams, EMs and Directors to gain buy-in and agree on effective implementation plans.
1. Uses hands-on tasks to help improve the department's processes around async communication and documentation to continually drive department efficiency.
1. Recognises and maintains high engineering standards within the department by using their own work to demonstrate what "good" looks like, setting review standards and contributing to wider technical discussions and decisions.
1. Helps teams to understand the current application, tools, and processes, and pragmatically leads the group towards the department's strategic goals with useful iterations of work. Creates dogfooding opportunities where possible, documents the gaps and engages with Engineering and Product DRI's where not.
1. Continues to grow technical skills and looks outside of GitLab to understand and contribute to industry best practices and common challenges.
1. Embraces the leadership aspect of this role and actively focuses on learning and development to support this skill.
1. Delivers on commitments by recognizing the different types of work needed in order for the group to succeed. Balances time and energy to stay connected to individual team goals and progress, and also makes time to drive mid to long term group direction.
1. Applies technical and leadership abilities to identify and resolve complex, and business-critical situations affecting the group. Ensures the work remains visible to others, and actively looks for knowledge-sharing or collaborative opportunities.

Autonomy

1. Manages time and workflow to identify and prioritize the most important tasks to help the group and department achieve their goals. Prioritization is done in collaboration with the EM and PM. Delegates work, and proactively shares priority changes to manage expectations both within and outside the teams.
1. Takes an active role in project management activities to ensure that the issues and epics correctly communicate impact, timelines, and dependencies. Mentors others to assess and communicate the same.
1. Works to understand the department and GitLab's current and upcoming priorities and works with teams within the group to prioritize suitable projects according to wider priorities. Converts strategic direction to practical outcomes.
1. Proactively looks for ways to improve individual and team workflows and capabilities across the department.
1. Recognizes when projects or tasks need stakeholders or other teams to be involved and fosters collaborative decision making and problem solving across the departments.
1. Plans around predictable events such as OKR setting, holidays, and team changes to make sure that technical information and metrics are available when needed.

Team building

1. Creates and maintains department culture by following the CREDIT values and helping other teams to do the same. Proposes improvements to our values and company culture where possible.
1. Works closely with Engineers, EMs, PMs (where available), and TPMs across the group and company. Helps to bridge the gap between technical and less-technical people for a shared understanding of the groups work and goals.
1. Contributes to the growth of others through championing, mentoring, and providing timely, kind feedback directly, and into promotion processes.
1. Owns the group's technical interview process and works closely with the hiring managers and interviewers to make sure that every candidate receives a standardised, positive interview experience.
1. Maintains connections across the company to stay connected to events outside of the group, and to help keep teams unblocked.

Principal Values Alignment

{{% include "includes/engineering-careers/values-competency.md" %}}

SECTION: engineering/careers/matrix/infrastructure/senior.md

{{% include "includes/engineering-careers/career-matrix-nav.md" %}}

Senior

Senior-level engineers in infrastructure are significantly contributing to their team's results and culture through personal results as well as through mentoring and setting team culture. Beyond this level, engineers can choose to progress into technical leadership (via the Staff Engineer level), or move onto the management track (via the Engineering Manager level).

Accountability

1. Sets the standard for handling on-call rotations, and supports and enables others to learn from their example.
1. Creates, follows, and improves processes and runbooks to enable themselves, and others to solve problems and make changes in production safely.
1. Bias for action when it comes to proposing and engaging improvements, discovery and addressing problems and inefficiencies, to document work, and provides sufficient information

to help prioritize these according to the team's workload.

1. Uses existing data, or looks to, create useful data to improve team decisions.
1. Always considers how their work will impact availability, performance, and operational overhead for production systems including GitLab.com and GitLab Dedicated systems. Assists others in doing the same.

Credibility

1. Significantly contributes to team success by delivering on team goals, acting as DRI for projects and leading team OKR discussions.
1. Creates and maintains epics and issues for all work to document decisions, track progress and allow others to contribute. Mentors other team members to do the same.
1. Continues to grow technical skills and looks outside of GitLab to understand industry best practices and common challenges.
1. Recognises and maintains high engineering standards within the team through their own work as well as by setting review standards and contributing to technical decisions.
1. Actively looks to gain a deeper understanding of how the current application, tool, or process works, why it works this way, and then brings a pragmatic view to improving it.
1. Represents the team and the team goals in interactions across the company. Is proactive about working with other team members and their manager to prepare for these interactions.

Autonomy

1. Manages time and workflow to identify and prioritize the most important tasks to achieve team goals.
1. Effective as a project DRI; sets up and maintains the project epic and issues for visibility and takes care to assess and communicate impact, timelines, and dependencies.
1. Works with their manager to identify and effectively collaborate with the stakeholders who will be impacted or interested in their work.
1. Understands the team's current and upcoming challenges, and works with their manager to prioritize projects and tech-debt to meet team goals.
1. Writes technical proposals comparing existing and desired state, defining a path to pragmatic and feasible solutions to team problems. Recognizes the pros and cons of the proposal and looks to adopt boring solutions wherever possible.
1. Actively works to understand GitLab tools and features and looks to create dogfooding opportunities for the team.

Team building

1. Creates and maintains team culture by following the CREDIT values and helps other team members to do the same. Contributes to the overall GitLab culture.
1. Mentors others to help them grow their technical skills.
1. Plays an integral role in team hiring through leading interviews, training others, and iterating on the hiring process to improve the candidate experience. Works closely with the hiring manager to understand the role requirements and support the hiring effort.
1. Recognizes and actively works to track and reduce interruptions affecting team throughput.
1. Acts as a multiplier for others through mentoring and pairing, as well as by leading effective projects that allow others to contribute.
1. Is aware of what a high-performing team is and works with their manager to identify and initiate improvements.

SECTION: engineering/careers/matrix/infrastructure/staff.md

{{% include "includes/engineering-careers/career-matrix-nav.md" %}}

Staff

Staff-level engineers in infrastructure significantly drive the department's results and culture by enabling teams to succeed. Staff engineers are seen as a partner of their Engineering Manager and are expected to balance the day-to-day details needed to keep their team unblocked with a longer-term view to anticipate changes needed for future success. Achieving this balance will often mean doing less of the hands-on work compared to previous levels, instead finding ways to enhance the results of the entire team. Staff engineers primarily focus on a team but work across the entire department to maintain relationships and share information.

Accountability

1. Upholds standards for on-call through their own behavior, mentoring of others, and improving the process to remove inefficiencies and learn from experiences.
1. Leads the technical direction with input from the team. Making sure that tech debt and future engineering needs are visible and being considered in OKR and prioritization discussions.
1. Represents the team across the company through behavior and sharing team direction to relevant groups. Actively looks for opportunities to connect engineers and engineering goals to their team goals.
1. Recognizes, surfaces, and actively works to resolve team friction or misalignments, and remove blockers that could impact the team or department.
1. Takes responsibility for the team's impact on availability, performance, and operational overhead. Builds good practices within the team to enable everyone to contribute their experience.
1. Maintains awareness of metrics to keep the team's progress visible at a department level. Creates or extends available metrics where needed and works with EM and PM to define team KPIs.

Credibility

1. Significantly contributes to department success by proposing practical team objectives that are pragmatic and move towards the department direction. Works with the team and EM to gain buy-in and agree on effective implementation plans.
1. Uses hands-on tasks to set the standard and help improve the team's processes around async communication and documentation to continually drive team efficiency.
1. Recognizes and maintains high engineering standards within the department through their own work as well as by setting review standards and contributing to technical discussions and decisions.
1. As part of their daily work, they continue to grow technical skills and look outside of GitLab to understand and contribute to industry best practices and common challenges.
1. Leads the team's technical direction by making sure designs and implementation are considering what the current application, tools, and processes do, and why, and pragmatically leads the team towards the department's strategic goals. Chooses dogfooding opportunities where possible, documents the gaps and engages with Engineering and Product DRI's where not. Works with Product and Development to ensure features serve the needs and scale of all users, including GitLab SaaS offerings.
1. Delivers on commitments by recognizing the different types of work needed in order for the team to succeed. Balances time and energy to stay connected to the team's day-to-day goals for knowledge sharing and mentoring and also makes time to drive mid to long-term team direction.

Autonomy

1. Manages time and workflow to identify and prioritize the most important tasks to help the team and department achieve their goals. Proactively shares changing priorities to manage expectations both within and outside the team.
1. Sets and upholds the standards for project DRIs, making sure that the team is maintaining epics and issues for current visibility and historical understanding. Mentors others to assess and communicate impact, timelines, and dependencies.
1. Works with the team's EM and PM (where applicable) to identify stakeholders who will be impacted or interested in the team's work and proactively shares information and establishes collaborative communication.
1. Works to understand the department's current and upcoming challenges and works with their manager to prioritize suitable projects
1. Enables the team to produce technical proposals to identify feasible solutions to team problems. Provides effective input to help propose a suitable solution to the problem, making sure the team considers pros and cons of the proposal and looks to adopt boring solutions wherever possible.
1. Proactively looks for ways to improve individual and team workflows and capabilities.

Team building

1. Creates and maintains team culture by exhibiting the CREDIT values in their behavior and helping other teams to do the same. Proposes improvements to our values and company culture where possible.
1. Proactively builds relationships and partners with EMs providing in-depth technical opinion where necessary.
1. Works closely with the team's EM and PM (where available) to bring a technical lens to team and product discussions. Helps to bridge the gap between technical and less-technical people for a shared understanding of the team's work and goals.
1. Helps others to grow through championing, mentoring, and providing timely feedback directly,

and into promotion processes.

1. Builds and maintains relationships with teams across the department and beyond to identify potential future opportunities and to keep current work unblocked.

1. Proactively shares relevant information with their own team, EM, PM, and other engineers to help share context and build a shared understanding of how their team fits into GitLab as a whole.

1. Owns the technical interview process and works closely with the hiring manager to make sure that current and known future technical needs are being met by hiring processes. Takes responsibility for documenting and training interviewers to make sure every candidate receives a standardized, positive interview experience.

1. Champions the GitLab mission by enabling and encouraging others to contribute to the Infrastructure code base.
