

takes you to the Jenkins console output.

- Return to the GitLab repository and highlight the Jenkinsfile maintained alongside the repo for consistency and versioning.

Bamboo CI Integration Demo

- Log into GitLab using your credentials
- Create a new project from any template
- Delete .gitlab-ci.yml
- Login to Bamboo using Bamboo Tanuki Cloud in 1Password.
- Create a new plan by selecting create -> create plan
- Select an existing project or create a new project
- Specify a plan name
- Choose an existing repo or link to a new repository (credentials may be required when linking to a new repository)
- Keep isolate build set to Agent Environment
- Select source code checkout and enable force clean build
- Save the changes and drag the task into final tasks
- Select Save and continue
- Select triggers tab
- Delete default trigger and add a new remote trigger
- Specify the IP addresses associated with your demo GitLab instance (Keep in mind you will need to provide load balancing IPs)
- Make sure the plan is enabled
- Select Run -> Run plan to confirm the plan can build from GitLab
- Return to the GitLab project and select settings -> integrations
- Select Atlassian Bamboo CI
- Fill out all fields and make sure to set the integration to active
- If you are having trouble finding the build key, you can find it within the URL of the plan page within Bamboo
- Save changes and edit README.md to make a quick commit
- Check Bamboo dashboard to see build triggered
- Create new branch off of master
- Within the Bamboo plan configuration page home page -> select plan -> 'actions > configure plan', select create plan branch
- Follow dialog and add new branch
- Edit README.md in new branch and commit the change
- Check Bamboo to confirm the change has been picked up by Bamboo

OpenLDAP Integration Demo (Adding Users)

- Log into the OpenLDAP GUI (details can be found in the SA vault)
- In the left navigation panel, expand the LDAP tree
- Click on the ou=users organization unit
- In the main panel, click Create a child entry
- Select Generic User Account from the available templates a new user form will appear
- Enter the new users information in the provided form, ensuring all required fields are populated
- Click Create Object, you will be presented with the opportunity to check and finally Commit
- Commit the new user to LDAP by clicking the Commit button

- You will then be taken to the newly created user account
- Navigate to the GitLab login screen, here you will see the option to login using LDAP.
- Enter the user id and password used when creating your new user within OpenLDAP
- Click Sign In
- Newly created users will be taken to their profile page to update their Email field and confirm their Email address.

GitHub Integration Demo

- Navigate to [GitHub.com/signin](https://github.com/signin) and login using GitHub Demo Login in 1Password.
- Navigate to [GitLab.com](https://gitlab.com) and login using GitHub Demo Login (GitLab) in 1Password.
- Begin the demo by showing how to create a GitLab project linked to a GitHub repo. Click on the + icon to create a new project in GitLab.
- Select the CI/CD for external repo tab and highlight that you'd use an access token from GitHub to access GitHub repos within GitLab. Don't create a new project at this point (cancel).
- Switch to GitHub. Click into the spring-boot-test project repo.
- Create a new branch using the Branch:master button.
- Click into the `src/main/java/hello/HelloController.java` file and make a minor change to the screen message.
- Add a commit message and click the Commit Changes button.
- Click on the Pull Requests tab and click the New pull request button.
- Compare changes using `base:master` and `compare:yourbranch`.
- Click Create pull request.
- Scroll down a bit and note the amber wording Some checks haven't completed yet.
- There is a GitLab logo when this check is expanded. Click the Details hyperlink inline with the GitLab logo.
- Note that you are taken directly to GitLab's pipeline page in the associated project. This pipeline can take up to 10 minutes to run, but once complete, the pipeline status is returned to GitHub.
- While we wait for the pipeline to complete, note that the complete history is available for the pipelines run in GitLab.
- Also note that the repo and branches are mirroring from GitHub dynamically, but issue management and merge request options have been removed from the GitLab UI since the GitHub issues and pull requests are used instead.
- After time has elapsed, return to the GitHub pull request to show the pass/fail status displayed in GitHub.
- Optional: Other existing pull requests may be used to show the linkage without committing changes or creating new pull requests.

Conclusion

GitLab, leveraging built-in integrations, can work with existing Jira, GitHub or Jenkins systems, flowing work and updating status bi-directionally between those tools and GitLab.

SECTION: marketing/brand-and-product-marketing/product-and-solution-marketing/demo/off-line-click-throughs.md

Running Click-through Demos Off-line

Set your laptop up to run Google slides off-line

This is best done by following the instructions at
<https://business.tutsplus.com/tutorials/google-slides-offline--cms-29532>

MAKE SURE you do the above instructions with the SAME Google login you will use on your laptop when running off-line!

Pre-load the demo files you will want to show off-line

They are located in the Company Google drive

The specific files are:

- Secure Capabilities (11.8) - New as of 2019-03-09
- Auto DevOps Run (11.3)
- Auto DevOps Setup (GKE) (11.3)
- Auto DevOps Setup (EKS) (11.3)
- Auto DevOps (short, guided) (11.0)
- Secure Capabilities Demo (short, guided) (11.8) - New as of 2019-03-09

Using the demo files while off-offline

Once off-line, to run these presentations:

1. Open up your Chrome browser and make sure you are logged in as the same user you used in the previous setup
1. Go to <https://docs.google.com/presentation>
1. Find the files you want to present (they should be in the same folder structure that you previously looked at them in)
1. Open the presentation you want to show and it should just work.

Misc

Looking for older versions? They are in the G-drive "Archive" folder.

SECTION: marketing/brand-and-product-marketing/product-and-solution-marketing/demo/sim-demos.md

Summary

This page covers how to use and create simulation demos.

What is a simulation (sim) demo?

There are certain times when slides, video or other such media just will not do. When you are with a customer or on a trade show stage, a live product demonstration is far superior to slides or videos. Live demos, however, can be fraught with challenges, from technical issues to

poor content or delivery. Sim demos ensure every demo presentation, with groups small or large, is done perfectly every time, eliminating technical and content challenges. Sim demos are reliable, easy to present and give the audience a life-like demonstration EVERY TIME.

What is the difference between sim demo and a click-through demo?

Our definition for the legacy offline demos is a click-through demos. Click-through demos are Google Slides presentations, and they help to demonstrate product features or usecases. Each slide contains a product screenshot, annotations, and some bullets.

The newer offline demos called simulation (sim) demos. They are executable files for MAC or Windows that you can run locally, and there is also html version. We produce them with a tool called DemoEasel.

Both click-through and sim demos look and feel like live demos, the audience of the demo get the experience of a live product, and the person who deliver the demo can focus on what to say, and will have confidence that the flow will always run without any risk .Sim demos also include short animations between clicks to enhance the realism.

Both the legacy click-through demos and the new sim demos are available from the [Learn@GitLab](#) page.

Using click-through and sim demos

Who can use click-through and sim demos?

- New employees - Use it to learn the product.
- SDRs , Solution Architects, SAE, - Deliver GitLab demos to customers.
- Executives - Deliver keynote demos, or deliver demos to executives.
- Field marketing - use sim demos in trade shows and events.
- Whenever you need to deliver GitLab demo, but you don't have internet access.
- Non-technical users that would like to see how the product works and even present it.

How can I use a click-through demo?

- They will launch and run in your web browser. Alternatively, you can go to the file in Google Slides and run them from there.
- They use standard Google Slides presentation interface

How Can I use a sim demo?

- Download the demo locally
- Extract it
- Open the demo executable
- If you have macOS Catalina - follow the steps in the next section, then come back here and continue
- Click Present Demo
- If you need help with the sim demo, contact TMM either by Slack channel [dev-advocacy-team](#) or by opening a Product and Solution Marketing Request issue.

MacOS Catalina

In MacOS Catalina you will get an error when you open the demo file.

To open it, right click on the demo file -> Open

A new dialog will appear, click Open.

Creating sim demos

Who can create sim demos

Everyone can download DemoEasel and record and edit demos, you don't need a license to create and edit demos. However, in order to generate demo packages, a license is required. The Developer Advocacy team purchased licenses and the team will be happy to generate packages for you. The priority will be for customer facing demos, which can be reused by other team members.

Define the use case

Demos should highlight the value of the product, it should demonstrate how it solves a market challenge. Focusing on features, no matter how they robust, will not be relevant to the customers if they don't understand how it solves their challenges.

To plan a winning demo

1. Identify a customer challenge and how GitLab solves this challenge.
1. Define a demo flow that shows how we solve this challenges, and how we do it better than our competitors.
1. It is recommended to create short demos, up to 20 steps (clicks/screens), demo that you can present in 2 to 5 minutes.

Prepare your environment

1. Close all opened windows, keep only Chrome window with GitLab instance opened.
1. You should have a stable demo flow configured with the right demo data, ready for screen capturing.
1. Prepare your browser, hide bookmarks and notifications.
1. Hide OS notifications.
1. Use the following script to resize Chrome to the required resolution.
1. Open Script Editor in your MacBook and paste this script to it

text

```
set theApp to "Google Chrome"
```

```
set appHeight to 1080
```

set appWidth to 1920

tell application "Finder"
set screenResolution to bounds of window of desktop
end tell

set screenWidth to item 3 of screenResolution
set screenHeight to item 4 of screenResolution

tell application theApp
activate
reopen
set yAxis to (screenHeight - appHeight) / 2 as integer
set xAxis to (screenWidth - appWidth) / 2 as integer
set the bounds of the first window to {xAxis, yAxis, appWidth + xAxis, appHeight + yAxis}
end tell

1. Run the script. This will resize your browser to 10801920. If necessary, you can modify those parameters in the script for different screen resolution.

Capture the demo

1. Download and install DemoEasel.
1. Open DemoEasel, click New Demo, read and follow the tips that presented , then click Start Capture.
1. Navigate through your flow. DemoEasel will capture all screens and clicks.
1. To finish recording, click the DemoEasel icon on the bottom dock to bring up its UI
1. Click Abstract Demo.
1. DemoEasel will automatically recognize the recorded window (Chrome) and will suggest Auto Cropping, accept this option.
1. Define a name for your demo, click OK.

Edit and Optimize

Once a demo has been captured we can use DemoEasel's editor to optimize and document it so that others can easily present the demo.

1. Select from the demo list the demo you want to edit, click Edit the Demo button.
1. The editor provides some basic and advanced capabilities. For starting out, it is essential for you to get familiar with the following items:
 - Red boxes - Make sure all red boxes that automatically added look good, with correct location and size. You can adjust them manually as necessary by dragging them to the right position.
 - Edit Note - Add a note for each step, the note describes the step, and specifies where is the next click.
 - Review ALL recorded frames, hide unnecessary recorded frames.
 - Control the speed of the frames.
 - Export / import frames.

For more info, read the Getting Started.html in your DemoEasel folder.

Package and Share

There are two types of packages we use at GitLab: browser(HTML5) and simulation (Windows/macOS executables).

The Developer Advocacy team produces and upload browser demo packages to the demo page in handbook so employees and customers can learn the product and use cases. As it supports iOS, we also use the browser type to demo GitLab in demo booths in events.

For customer facing demos or keynotes, it is recommended to use the simulation version as it has better performance and actually gives the audience a more live-like demon experience. However, for transparency, when we present a simulation demo, we always announce at the beginning that this is a product simulation, not a live demo.

While everyone can contribute and create sim demos, due to license restrictions, and for keeping consistency of the messages, and ensuring consistent high quality and look and feel, the Developer Advocacy team will review the demos, provide feedback, and then generate the final demo packages for you.

To request the team to review and generate demo packages

1. Once you created and completed the demo editing, notes and optimization, Go to 'Demos' folder under your DemoEasel installation folder and locate a folder with the name of your demo (this folder contains three files).

1. Upload the entire folder to source files. Set access permissions to anyone in GitLab.

1. Open a Product and Solution Marketing Request issue.

1. Select Demo or workshop for the "Type of work requested".

1. Under "Request details" add:

1. "Sim demo publishing support"

1. Describe the customer challenge and the solution you demonstrate in the demo.

1. Include the path of your demo files you uploaded.

The team will review the demo and might have some improvement suggestions. Once the demo is ready for release, the team will produce the demo packages, will provide you a link to it, and will close the Issue.

SECTION: marketing/brand-and-product-marketing/product-and-solution-marketing/dod12/2019-best-executive.md

This is one of two pages submitted for the 2019 DevOps Dozen Awards, supporting Sid Sijbrandij for Best DevOps Solution Provider Executive and supporting GitLab for Best DevOps Solution Provider. We thank MediaOps and DevOps.com for their consideration and their service to the DevOps community.

Sid Sijbrandij: True DevOps Practitioner-Executive

Sid leads GitLab by embracing and following DevOps practices for every aspect of building GitLab the company, its culture, and GitLab the product. He starts with ingraining DevOps philosophy into our core values. Two good examples are the values of Iteration and Transparency. Sid truly believes the smallest possible change that makes any improvement should be published, and with a low level of shame. This enables everyone at GitLab to push the smallest possible iteration to the world, get feedback from the community, and incorporate that feedback in rapid, fast improvements. These principles are applied to every aspect of the company, from engineering to product management, to marketing, and even sales.

Transparency is another core value that drives Sid's vision and embracing of DevOps in every aspect of running the company. Everything is public by default, with few exceptions such as for confidential customer data. This helps us get continuous feedback from our community, a key tenant of DevOps.

Community Leader

Sid not only leads GitLab, the company of 1095 employees, he is also a key driver in the creation and growth of the wider GitLab community. Over 2,700 contributors have shared their talents and are committed to improving GitLab as a solution to their DevOps challenges, making it possible for everyone to contribute.

Forging the future of work

Like all successful companies, GitLab has carefully crafted values which our CEO, Sid both espouses and evangelizes. GitLab's company values, however, are not only good things that all good employees should pursue, like integrity or innovation. Our values are key to GitLab's success and in many ways they are mission critical.

GitLab's values are mission critical because our all-remote way of working would be impossible without them. GitLab has an uncommonly diverse and distributed workforce, with more than 1,095 employees in 65 countries and 0 offices. We also work asynchronously by default, requiring uncommonly strong culture and leadership.

GitLab's values can also be challenging. One of our top values, for example is transparency, toward which we believe all companies should strive, but without which an all-remote company cannot function. Because our values can be difficult to practice, we rely on Sid's personal resolve and encouragement of us all, to be transparent even and especially when it is difficult.

We have intently defined our values and how they enable all-remote work. Those and all GitLab Handbook pages, including the one you are reading right now, are editable by GitLab team members and by anyone through our GitLab.com service. For the sake of transparency, everything we do is public by default, from the repository for this handbook and our web site to our issue trackers, infrastructure · even our marketing.

Working all-remotely underpins our other values, too like our value of diversity, inclusion and belonging in that all-remote work supports inclusion and bolsters communities. GitLab's mission is "everyone can contribute." We're forging that future today, both through the product we build, and the ways in which we build it and run our company.

It's not SidLab, it's GitLab

When creating a branch to work in git, you name the branch. During a recent, live-streamed coaching session on collaboration, Sid explained why he does not include his personal initials or name in his branch names. He doesn't want to discourage others from contributing to his work. As he put it, "It's not SidLab, it's GitLab."

Many such anecdotes attest to Sid's demonstration of collaboration, transparency, and our other values. A notable few of the many examples of his leadership include:

- Sid's README
- GitLab's CEO Shadow Program
- Our GitLab Unfiltered YouTube channel, where Sid often shares recordings and live streams of his meetings, while encouraging us to do the same

Sid holds office hours to coach GitLab team members on our value of iteration, and meets with and coaches CEOs of other startups as well. His interactions are streamed or recordings shared, optimizing his contributions to the future of work.

GitLab values have won Sid his share of fans. In June 2019, GitLab landed on Inc.'s annual Best Workplaces list as compiled from employee surveys, and Sid's approval ratings by employees and community members alike are among the best in the business, as compiled by Glassdoor and Comparably.

In the Bloomberg interview below, Sid describes how being all-remote helps the company practice its values:

```
<!-- blank line -->
<figure class="videocontainer">
  <iframe src="https://www.youtube.com/embed/AtfE4rB0kis?start=157" frameborder="0"
allowfullscreen="true"> </iframe>
</figure>
<!-- blank line -->
```

The proof of the pudding

With Sid's leadership, GitLab is emboldened to capitalize on and share our own DevOps journey in pieces like this blog post. As converts we are zealots, all the better able to build software that helps our customers in their DevOps journeys. Thousands of GitLab community members and employees have contributed to making this work, but as our co-founder and CEO, we have Sid most of all to thank for enabling us to forge a better future for work.

The proof of the pudding is in the eating, and Sid's way of working is not only generous, it's also generative. Highlights of our growth in 2019 include:

- \$268M in series E funding with a \$2.75B valuation, doubling in less than a year
- 143% growth rate in annual recurring revenue, showing customer satisfaction and strong demand, with an expectation of \$100M ARR in January, 2020
- 2.5x growth in team members from 431 to 1095, and very much still growing

SECTION: marketing/brand-and-product-marketing/product-and-solution-marketing/dod12/2019-best-solution.md

This is one of two pages submitted for the 2019 DevOps Dozen Awards, supporting GitLab for Best DevOps Solution Provider and supporting Sid Sijbrandij for Best DevOps Solution Provider Executive. We thank MediaOps and DevOps.com for their consideration and their service to the DevOps community.

GitLab: A community and a product

The GitLab solution is the result of collaboration between thousands of community contributors, based on feedback from the over 100,000 organizations that have adopted GitLab to power their DevOps transformations. The GitLab community contributes code, documentation, translation, design, and product ideas based on their real world challenges, making GitLab more useful and valuable. Because of the community behind GitLab, in many cases, we see rapid adoption through better developer experience and collaboration. These naturally drive users to adopt and contribute more, enriching the application every day.

GitLab: A complete DevOps platform, in a single application

GitLab fundamentally changes the way development, security, and ops teams collaborate and build software · helping customers on their DevOps journey in ways no other company can · by providing a single application for the entire DevOps lifecycle.

DevOps toolchains are often complex, fragile, and expensive to maintain. Teams are further slowed by hand-offs and re-work. Across toolchains in a company, teams can be siloed by DevOps software that was supposed to help eliminate siloes.

GitLab customers can have SCM, CI, security, and more in one browser window. They can minimize integrations and get back to releasing great software. GitLab CI and CD are truly continuous, speeding up releases and revenues. With one user experience, one permission model, and one conversation from portfolio management to production monitoring, company-wide gains include visibility, collaboration, and speed · making good on the promise of DevOps.

A partner like no other

GitLab is uniquely open and transparent about our vision and roadmap, our internal processes, our product maturity, and we invite and encourage community and customer contributions and collaboration.

This short video summarizes our unique DevOps solution and bold way of working:

<!-- blank line -->

<figure class="videocontainer">

<iframe src="https://www.youtube.com/embed/MqL6BMOySIQ" frameborder="0" allowfullscreen="true"> </iframe>

</figure>

<!-- blank line -->

What people are saying

Customer case studies

Our case studies feature GitLab customers sharing their accomplishments, in their own words, including the few introduced below.

- Goldman Sachs had already started their DevOps journey, but progress had stalled before they began using GitLab. After reducing their toolchain complexity by implementing GitLab for development, source code control and reviews, builds, testing, QA, and production deployments, Goldman Sachs' build velocity was dramatically improved, from 1 build every 2 weeks to over 1,000 per day.

- At BI Worldwide, they had built multiple, complex DevOps toolchains resulting in issues like lost bug reports and constant context shifting. Now with broadening GitLab adoption, they describe their DevOps success:

- > "One tool for SCM+CI/CD was a big initial win. Now wrapping security scans into that tool as well has already increased our visibility into security vulnerabilities. The integrated Docker registry has also been very helpful for us. Issue/Product management features let everyone operate in the same space regardless of role."

- >

- >· Adam Dehnel, product architect, BI Worldwide

From enterprise customers and an established retailer like Fanatics, to a growing startup like Glympse, GitLab's singular approach offers efficiency, velocity, reliability, and more at levels only possible with a truly seamless, continuous solution.

Peer reviews

GitLab is a 2-time Gartner Peer Insights "Customers Choice" award winner, recently in the 2019 Enterprise Agile Planning Tools following on our recognition in the 2018 Application Release Orchestration. Below are a few select quotes from Gartner Peer Insights and G2 Crowd reviews:

- "GitLab, the central hub of DevOps. This is an overall application for the entire DevOps lifecycle, which is amazing."

- "Makes you highly efficient while developing software with big group of people."

- "Our developers do not have to mind shift between coding and tracking their work. Having the source code available next to planning boards makes the shift that much simpler."

- "Powerful team collaboration tool for managing software development projects."

- "GitLab is an amazing solution with a very fast-paced feature release cycle. They are great at listening to our feedback and incorporate in future roadmaps."

Analysts

GitLab's unique breadth in DevOps has enabled us to enjoy similarly broad coverage across analysts' categories and reports. A few highlights across the DevOps lifecycle include:

- GitLab named 'Visionary' in Gartner's 2019 Enterprise Agile Planning Tool Magic Quadrant

- Forrester named GitLab a leader in 2019 Wave for Cloud-Native Continuous Integration Tools

- Forrester recognized GitLab as a Challenger in 2019 Wave for Software Composition Analysis

GitLab's vision

GitLab's vision is extensively documented and open to editing. Our mission, "Everyone can contribute" is already true within GitLab the company, where we leverage GitLab the product to run the company. With GitLab we collaborate and complete everyday tasks like organizing events, onboarding new employees, and documenting how we work with this handbook. The direction is clear: we will continue to broaden and deepen GitLab's capabilities to make our mission true for all our users, making it faster and easier for them to share, collaborate, and contribute.

SECTION: marketing/brand-and-product-marketing/product-and-solution-marketing/dod12/_index.md

SECTION: marketing/brand-and-product-marketing/product-and-solution-marketing/enablement/_index.md

SECTION: marketing/brand-and-product-marketing/product-and-solution-marketing/enablement/cloud-native-ecosystem.md

- Video
- Slide deck

"The advent of cloud native has empowered engineering leaders to procure and purchase software that helps them ship faster and reliably. These engineering leaders are different from the usual high ticket item buyer and an understanding of their persona is critical to success when selling DevOps software." - Priyanka Sharma

The Champion Persona

Sub section of the Buyer Personas

- /handbook/marketing/brand-and-product-marketing/product-and-solution-marketing/buyer-personas
- Wider than Dir./VP. Anyone with overview of multiple teams and their productivity is a Champion

Potential titles

- Director of Eng, VP of Platform, Systems Architect, Snr. Manager, Team Lead

Ability to buy

- Their direct boss can cut million dollar checks without needing to heavily involve CIO. Need to go through procurement still.

Responsibilities and promotion criteria

- Lead multiple teams and have insight into cross-org productivity challenges
- Promoted for shipping fast and reliably AND for introducing systemic improvements

Self image

- Primary work self-image: technologist. They always want to be on the cutting edge and know the latest
- Well-compensated and aware of it but humble and down-to-earth in general about socio-economic factors
- Intellectually elite(st?)

Where to find them

- Online: Twitter, HN front page, passively on LinkedIn (hate InMail)
- Meetups: Papers We Love, Some Kubernetes events, Small group events hosted by high end technologists like Bryan Cantrill, workshops
- Conferences: KubeCon, Monitorama, Strangeloop, PromCon, GrafanaCon, SRECon, GopherCon, etc. (systems conferences)

What they appreciate

- Conversations about our Kubernetes ecosystem, the latest trends in cloud computing (serverless, monitoring, etc)
- Straight shooting
- Empathy for their struggles
- Demos and technical knowledge (strategic level ok and appreciated)

What they don't like

- Pitches that sound canned
- Mass email

My engagement strategy

- Be a peer (tweet, talk)
- Teach them something new
- Talk tech - be up to date
- Be credible (cite papers, reference industry experts)
- Be ready to do a demo at moment's notice
- Help - contribute generously
- Sell intellect and empathy, the \$\$ will follow

What you can do

Scope

Identify the sub-sections of personas that are the most lucrative for you

Leverage

Find peers the personas trust. Join them and ask to tag along

Converse

Reach out consistently and loop in the peers from time to time. Responsiveness is the key to success.

SECTION: marketing/brand-and-product-marketing/product-and-solution-marketing/enablement/dotcom-subscriptions.md

How GitLab.com subscriptions work

GitLab.com subscriptions work slightly differently to Self-managed licenses.

Unlike Self-managed licenses which grant equal access to features across an installation, GitLab.com subscriptions are applied to namespaces on GitLab.com (typically groups). Members of groups that have subscriptions applied to them will enjoy those features anywhere within the licensed namespace. For example, if BigCorp has an Ultimate license, the sub-groups BigCorp/Frontend, BigCorp/Backend will each have access to Ultimate features and share a common pool of Shared Runner minutes.

Common Misconceptions

1. Misconception: If I'm in an Ultimate group, my GitLab.com profile should say "Ultimate"

- Reality: GitLab.com subscriptions are scoped to a namespace, and individual users could participate in many groups with different subscription types. For example, they might have personal projects on a Free subscription type, participate in an open-source project that has Ultimate features (because it's public) while their company has a Premium subscription.

1. Misconception: Subscriptions grant "the midas touch" and any group or project a subscription-bearing user creates will get the features of their subscription level. i.e. an Ultimate user will be able to create Ultimate groups in which all members will have Ultimate features.

- Reality: Subscriptions can be applied to group namespaces only and all items created within said namespace will receive the features of the subscription level.

- Reality: All users invited to the group namespace will be able to enjoy the features of that subscription only while working in the subgroups and projects within the group.

- Reality: User's accounts, also called personal namespaces, will by default be on the Free plan. Any group, subgroup, or project created in a personal namespace will also be on the Free plan.

- Reality: Note, as of November 17, 2020, GitLab no longer offers new subscriptions for personal namespaces.

1. Misconception: A license key will be emailed out and applied somewhere in the UI of GitLab.com

- Reality: Subscriptions are managed, and applied, through <https://customers.gitlab.com> on a linked GitLab.com account

1. Misconception: Someone in accounting made the purchase and can pass along the subscription to the team using it.

- Reality: Subscriptions are managed by a GitLab.com account who has Owner in the group.

1. Misconception: I should purchase my subscription first before setting up accounts on GitLab.com

- Reality: You can do this in any order, most will find it easier to set things up on .com before they purchase, with the exception of those who want to set up SAML.

1. Misconception: I can apply different subscription levels to subgroups.

- Reality: Subscriptions are applied to top level groups; sub-groups inherit their license (and Shared Runner minutes) from the top-level group.

1. Misconception: Minutes are deducted from my group for any jobs that are run, even on my personal runners.

- Reality: Runner minutes are deducted only from jobs run on GitLab.com Shared Runners, you can set up your own runners per project or group without affecting your shared minutes.

Trials

1. Trials should be initiated by users by going to the Settings page of the group that they want to apply the trial to.
1. At writing (2019-06-05) Premium trials are not generally available. Support can manually downgrade a trial by request
1. At writing (2019-06-05) Trials must be manually downgraded before a purchase can be made.
1. Support is not included with trials Please participate in this issue

Internal namespaces

GitLab subscriptions for internal namespaces are managed by the IT Operations team. To request a subscription to an internal group or internal project, please submit an individual access request.

Common issues the Support Team encounters with sales-assisted purchases

1. New Customers

- The support team sometimes receives tickets in Zendesk from sales-assisted clients with basic questions like how to set up groups, how to add additional users, why subscriptions are applied to groups vs users, permission questions, etc. Support will direct them to corresponding documentation to address their questions.

- Customers are typically not aware that creating an account in the CustomersDot does not create an account on GitLab.com or how to link a CustomersDot account to their GitLab.com account.

1. Upgrades/Downgrades

- There is presently not a self-service way for customers to upgrade/downgrade subscriptions so any of these requests must go through the sales team via a queue in Zendesk.

- Requests can sometimes be delayed by the volume or lack of information provided when the ticket is sent to Sales.

1. Dealing with True-ups

- Support team sometime receives tickets in Zendesk from sales-assisted clients with problem concerning true-up being reconciled before the subscription renewal.

- Case: The customer purchased a license for 39 Premium seats with start date of 2020-03-04 and end date 2021-03-04. During the license period, the customer add more users to the system that incurs 112 Users over license/True-up. If this is charged as True-up on SFDC, the new license will not include the extra users in the current term so the customer would end up with a license with 39 seats and 112 true-up which cannot be uploaded to their system because they now have $39 + 112 = 151$ billable users on the system.

- If the customer would like to deal with Users over license/True-ups, it should be charged as Add-on users to the license as mentioned in Quarterly Self-Managed Seat Reconciliation & Billing.

1. Dealing with Add-ons Users

- In contrast to Dealing with True-ups, if the customer purchased Add-on users while there's only a few weeks left before their renewal, please reconcile the Users over license/True-ups at the renewal instead.

- Assisting the customer on purchasing Add-on users when there's only a few week left until the license expires will resulted in an error license once the purchase is processed. Please take into consideration the existing license Service Period, the time it takes to process the purchase, and the time for the customer to upload the license.

How we can set the customer up for success

The best way to assist a user or system admin on any new platform is to arm them with the resources they will need when questions arise. During the onboarding process after the sale, the user/admin will receive an email from GitLab with pertinent information about their subscription. Highlight this and encourage them to save it somewhere easily accessible. While many of the links below are included in the email, it would be helpful to review each of the following resources personally with the user/admin.

1. GitLab Documentation

- 1. Administrator Documentation (self-managed only)
- 1. Subscription setup and management
- 1. Licensing and subscription FAQ
- 1. Uploading your license (self-managed only)
- 1. Features available by plan: GitLab.com & Self-Managed
- 1. Support portal
- 1. Statement of Support

A few more best practices to ensure a smooth start

1. On this page, you'll read about differences between GitLab.com and Self-Managed functionality. Whenever in doubt, don't hesitate to ask us about a particular feature/functionality which is important to your prospect prior to promising it is available. For a question like this, contact us on Slack in the supportgitlabcom or supportself-managed channel.

- 1. Be sure to stress to the new user/admin to submit their support issues directly to us via the Support Portal instead of using you as a go-between. This will provide the most timely and comprehensive support we can offer.
- 1. If you find yourself having to submit something on behalf of the user/admin, do not submit a ticket via the Support Portal/Zendesk. Instead, create an issue in internal-requests.
- 1. For GitLab.com, make sure the user understands how to link their GitLab.com account to the CustomersDot and how to associate their group with their subscription. See managing subscriptions page for instructions.

Important differences between GitLab.com and Self-Managed subscriptions

The Pricing page includes a "Frequently asked questions for GitLab.com" section that answers "What features do not apply to GitLab.com?" in detail. Here are some highlights:

- 1. Features availability including SAML/LDAP is Free vs. SAML SSO is Premium.
- 1. Access controls: customer is admin on GitLab instance vs. group owner on GitLab.com
- 1. Log information and auditing: unrestricted access vs. no access on GitLab.com (can work with Support/Security to answer questions)

- On GitLab.com, each user is "signing a contract" (TOS, privacy policy, etc) as individuals, regardless of what email domain they use. Because of that, we cannot provide their employer with any personally identifiable information (like email address, log info, etc.) as it would be a violation of the user's contract.

- 1. Instance wide settings: custom vs. same for all GitLab.com users
- 1. Infrastructure: manage your own, anywhere vs. GitLab manages HA Architecture, instance level backups/recovery, upgrades, based in US

Release date

2018-03-22

GitLab Press Spokespeople

Mark Pundsack

Q: What is covered in today's announcement?

A: With GitLab CI/CD for GitHub, enterprises working with multiple different types of code repositories can now standardize on GitLab CI/CD for seamless consistency across both their GitHub and GitLab code repositories. Open source projects that host their code on GitHub can take advantage of CI/CD on GitLab SaaS, where GitLab offers top tier features for free to open source projects.

Q: What is the headline of the press release?

A: GitLab Brings Industry-Leading Continuous Integration and Deployment to GitHub Community

Q: Who is quoted in the press release?

A: Sid Sijbrandij: "Continuous integration and deployment form the backbone of modern DevOps," said Sid Sijbrandij, CEO and co-founder of GitLab. "With this new offering, businesses and open source projects that use GitHub as a code repository will have access to GitLab's industry leading CI/CD capabilities."

Q: Where can I view a copy of the press release?

A: <<https://about.gitlab.com/press/releases/2018-03-22-gitlab-cicd-github-integration/>>

Q: Is there a blog post providing more detail on the announcement?

A: Yes, there are more details in the 10.6 release post [[link to blog post](#)]

Q: Is there a landing page for the feature?

A: Yes, <https://about.gitlab.com/solutions/github/> [will go live 2018-03-22]

<https://about.gitlab.com/solutions/github/> will also redirect to the longer URL and can be used in social, emails, etc.

Q: Are there other activities associated with this announcement?

A: We are running a promotion that makes this feature available (normally a Premium feature)

part of the Free tier on GitLab SaaS for one year. (Self-managed customers have access in the Premium tier.)

Q: Is GitLab CI/CD for GitHub generally available?

A: Yes

Q: Does GitLab CI/CD also integrate with Bitbucket? Other solutions?

A: Yes, but the process is more manual. GitLab CI/CD can connect to any git repo via URL, including Bitbucket, and configure status webhooks manually. Docs on how to manually enable GitLab CI/CD. (With GitHub the process is all automatic.)

Q: How does GitLab CI/CD integration to GitHub work?

A: GitLab users can create a CI/CD project in GitLab connected to an external GitHub code repository, which automatically prompts GitLab CI/CD to run whenever code is pushed to GitHub and post CI/CD results back to GitHub when completed.

Q: What are the key features of GitLab CI/CD for GitHub?

A: The ability to easily set up GitLab CI/CD on GitHub is the main feature enabling continuous integration, security testing, container registry, CD/release automation, configuration management, and monitoring.

Q: What opportunity is GitLab addressing with GitLab CI/CD for GitHub?

A: Several

Enterprise opportunity

With large enterprises we have 2 opportunities:

1. New starting point for GitLab adoption. Many enterprises adopt GitLab gradually over time starting with SCM. The GitHub Integration provides another starting point for enterprises to begin adopting GitLab by using CI/CD first.
2. Standardize on GitLab CI/CD with disparate SCM solutions. How many GitLab users do they need if they are using GitHub for SCM?

Open Source Projects opportunity

GitLab is committed to supporting open source. ON GitLab SaaS, open source projects get unlimited concurrent jobs and 50K compute minutes per month for free. The GitHub Integration allows projects who host their code on GitHub to use GitLab for CI/CD for free.

Broader GitHub community opportunity

By making GitLab CI/CD for GitHub available free of charge as part of our GitLab SaaS Free tier we are allowing anyone who uses GitHub.com to host their code, to use GitLab SaaS for their CI/CD. This is a way to expand the reach of GitLab and expose GitLab to users who may otherwise

have not tried GitLab out.

Gemnasium Customer opportunity

Gemnasium customers who are using GitHub now have a migration path to use the Gemnasium features we've built (and will build) into GitLab CI/CD Security Testing. Note: Gemnasium customers will need Ultimate to take advantage of Security Testing.

Q: Is GitLab CI/CD for GitHub available as a standalone product?

A: No, GitLab CI/CD is a Premium functionality and is not a standalone product.

Q: How is GitLab CI/CD for GitHub priced?

A: GitLab CI/CD for GitHub is a feature of GitLab without stand-alone pricing.

It is part of our Premium (Self-managed & SaaS) Tiers - \$19 /user /month (For all GitLab Premium features including CI/CD for GitHub.)

Promotionally, we will make the GitLab CI/CD feature available as part of the Free Tier on GitLab SaaS through 2019-09-22.

Q: How many GitLab users are needed?

A customer only needs 1 service account on GitLab to run pipelines for GitHub code, but will benefit from having more user accounts.

What are the pro/cons for the business if they create one service account for their pipelines?

Pro:

- Cheap

Cons:

- Developer will have a pass / fail status report in GitHub, but won't be able to drill down to see why a build failed without access to GitLab

- Developers won't have access to artifacts, pipelines output traces, registry images, or security reports.

Do they need users for each developer using GitHub/Bitbucket - why/why not?

No - It's not necessary, but enabling developers grants benefits:

- the ability to access artifacts, registry images, security reports, etc.
- the ability to see pipeline graphs, and detailed build reports

Do they need users for QA/ops engineers building the pipelines?

Yes - this should be sold against Jenkins / Travis, think about how many users you'd need to access those tools, and that is the user count that should have access to GitLab.

Q: What are the details of the launch promotion?

A: GitLab CI/CD for external repos, including GitLab CI/CD for GitHub will be available as part of the Free tier of GitLab SaaS for one-year plus extended six-month (through 2019-09-22). After 2019-09-22 we plan to move the feature to be part of GitLab SaaS Premium tier. Note: this is for GitLab SaaS only - self-managed customers will only have access in Premium & Ultimate.

Q: Are there any other features offered as part of a different tier promotionally?

A: At this time, no. This is the first time we've offered a feature like this promotionally in a different tier than it will eventually end up in,.

Q: Is GitLab CI/CD for GitHub available in both hosted and self-managed versions?

A: Yes, GitLab CI/CD for GitHub is available on all hosted versions and is available self-managed on GitLab Premium and Ultimate.

Q: What product plans include GitLab CI/CD for GitHub?

A: Self-managed: Premium and Ultimate

GitLab SaaS: Free, Premium and Ultimate (through 2019-09-22)

GitLab SaaS: Premium, Ultimate (after 2019-09-22)

Q: What stages of DevOps Lifecycle work with GitHub?

Stage	Product Category	Works with GitHub?	Notes
Plan	Portfolio management	No	
Plan	Issue Tracking	No	
Create	Version Control	No	Repos are Mirrored, which is needed for CI/CD, but there's no mechanism for Merge Conflicts so you can't actively use the GitLab Repo
Create	Code Review	No	
Verify	Continuous integration	Yes	
Verify	Security Testing	Yes	
Package	Container Registry	Yes	On by default once instance container registry enabled

Release	CD/Release automation	Yes	E.g. You CAN deploy to GCP using the GKE Integration
Configure	Configuration management	Yes	
Monitor	Monitoring	Yes	

Q: Do we have current customers using GitLab CI/CD for GitHub?

A: No, GitLab CI/CD for GitHub is being released and launched on the same day. As such, it will not be available for customers to use until after GitLab 10.6 is released on 2018-03-22.

Q: Will GitLab CI/CD for GitHub be available on the GitHub marketplace?

A: We have not made a determination if it will or will not be in the marketplace. It is a possibility, but requires additional complexity such as augmenting how we price. It is not available today as part of the marketplace.

Q: What press did we get?

- JAXenter:GitLab 10.6: CI/CD for GitHub, increased Kubernetes support, Jane Elizabeth, 3.23.18
 - "As part of their prior commitment to supporting open source, GitLab already offers all public projects their highest tier features for free. This means that open source projects on GitHub will be able to handle hundreds of concurrent jobs with 50,000 free compute minutes."
- ZDNet:GitLab makes CI/CD tools available for GitHub repositories, Stephanie Condon, 3.22.18
 - "GitLab is trying to reach more developers this way because it believes CI/CD is 'a core component of making your DevOps transformation,' Mark Pundsack, head of product at GitLab, told ZDNet.
- SiliconANGLE:GitLab brings code integration and delivery to rival hosting service GitHub, Maria Deutscher, 3.22.18
 - "By enabling software teams that use GitHub to handle the process with its platform, GitLab should make development operations considerably smoother for enterprises. In large organizations, different divisions often use different tools for their projects. Having a unified CI/CD tool that works across both GitLab and GitHub code repositories can take some of the complexity out of the equation."
- DZone:GitLab Opens CI/CD to GitHub Users, John Vester, 3.22.18
 - "When GitLab entered the market, their focus was to build a single application that meets the needs of every aspect of the DevOps lifecycle. As repositories begin to emerge on the GitLab service, those customers began to see the real value of such an application. Now, customers on GitHub/GitHub Enterprise can utilize those same CI/CD features, allowing the ability to standardize a single solution across the entire enterprise."
- TechCrunch:GitLab adds support for GitHub, Frederic Lardinois, 3.22.18
 - "The new GitHub integration allows developers to set up their projects in GitLab and connect them to a GitHub repository. So whenever developers push code to their GitHub

repository, GitLab will kick off that project's CI/CD pipeline with automated builds, tests and deployments."

SECTION: marketing/brand-and-product-marketing/product-and-solution-marketing/enablement/security-integrations-whitesource.md

Overview

Here you will find all of the content relevant to this integration.

Why the integration?

We are excited that WhiteSource has leveraged GitLab's open core software to build their integration with GitLab. Our open source approach enables GitLab customers to benefit from a vast community of partners and developers who contribute to GitLab's capabilities. The WhiteSource open source vulnerability management integration further augments GitLab's security capabilities across the entire DevOps lifecycle and provides GitLab customers the choice to leverage their existing tools.

Why WhiteSource?

WhiteSource customers asked WhiteSource to integrate with GitLab. WhiteSource leveraged our Core capabilities to begin the effort and have worked with GitLab to ensure that their integration optimizes customer value via GitLab Ultimate. They are the first and others are to follow.

Talking points

GitLab's open core software enables our customers and partners to contribute capabilities to our single application platform for the entire SDLC. Integration with features found only in the paid tiers, like the Security Dashboard, requires customers to purchase that tier.

Whitesource is the first security partner to integrate with GitLab's security dashboard, helping joint customers to see their software vulnerabilities early in the development process.

GitLab offers built in security scans, including static application security testing (SAST), dynamic application security testing (DAST), dependency, container and license compliance scanning early in development before the individual developer's code is merged with anyone else's. This workflow provides clear accountability and actionable insight empowering the developer to find and fix vulnerable code.

What type of integration - Technical, Inbound

Communications

WhiteSource will launch a press release on 14 January 2020 to accompany GitLab Commit SFO event.

SECTION: marketing/brand-and-product-marketing/product-and-solution-marketing/getting-started/101.md

Objective

A quick overview of how to plan and manage regular work using GitLab. The focus of this page is to help you learn how to work with Groups, Projects, Issues and Boards to plan and manage the your work and your team's work.

Note: If you are only looking for instructions on how to submit an Issue, feel free to skip forward to Issues in Action.

The Big Picture

Organizing

GitLab provides Groups, Sub-Groups and Projects to structure your organization's work and grant access to several members at once. For example,

- Group - Account Management
 - Sub-group - Regions - AMS, EMEA, APAC
 - Project - Countries - North America (within AMS), France (within EMEA), Singapore (within APAC)

Defining

GitLab allows you to group related work in the form of epics, sub-epics and issues - which are the smallest unit of work. For example,

- Epic - Annual Business planning
- Sub-epic - Quarterly Business planning (e.g., Q1, Q2, Q3, Q4)
- Issues - Plan for Individual Customers

Planning

GitLab facilitates planning your work with roadmaps with a start and end date, milestones and labels. For example,

- Group Roadmap - Timeline for your annual business planning
- Group Milestone - Key milestones during your planning - e.g., Start and end dates for Q1, Q2, Q3, Q4 planning
- Project Milestone - Deployment milestones for a specific customer

Doing the work

Projects can be used strictly for Issue Tracking, or for development of technology projects including source code, build, test, deploying applications.

Bringing it all together

The Details

GitLab Groups

In order to manage multiple projects (portfolios of projects), the GitLab Group is the entity that enables strategic planning and tracking of business initiatives through delivery. At the Group Level, you can manage sub-groups, projects, epics, milestones, roadmaps and group level boards. Groups With GitLab Groups you can assemble related projects together and grant members access to several projects at once. Groups can also be nested in subgroups.

GitLab "Project"

The project in GitLab is the core building block, where work is organized, managed, tracked and delivered. A project in GitLab enables the team to collaborate and plan their work in the form of Issues (use cases/requirements), Issue boards (Kanban), and Milestones (Sprints). With Projects in GitLab, you can create projects for hosting your codebase, use it as an issue

tracker, collaborate on code, and continuously build, test, and deploy your app with built-in GitLab CI/CD. Your projects can be available publicly, internally, or privately, at your choice. GitLab does not limit the number of private projects you create.

The GitLab Project is much, much, much more than simply project management. The GitLab project unlocks the power of an industry leading source code management repository and a CI/CD pipeline. The Merge Request is the linkage between the issue and the actual code changes. The merge request captures the design, implementation details (code changes), discussions (code reviews), approvals, testing (CI Pipeline), and security scans.

Group vs Project

Group

- Groups are like 'folders'

Project

- Projects have many 'things' like issues, repositories, merge requests, etc.

Hands on: Explore Groups and Projects

- Link to the GitLab Marketing Group
- Link to [www-gitlab-com](https://www.gitlab.com) Project
- GitLab 101 Exercise Group and Projects This group (subgroups and projects is for GitLab 101 exercises)

Labels

The label in GitLab is a flexible and powerful mechanism to tag and track work. Labels are used to define columns in the issue boards and make it easy to search and find issues or merge requests related to a common theme. Labels can be defined at EITHER Group or Project level

Labels allow you to categorize issues or merge requests using descriptive titles like bug, feature request, or docs. Each label also has a customizable color. Labels allow you to quickly and dynamically filter and manage issues or merge requests you care about, and are visible throughout GitLab in most places where issues and merge requests are located.

Hands on: Explore Group and Project Labels

Explore these two examples of Labels:

- Link to Group Label List in the GitLab 101 Group
- Link to GitLab 101 ABM Sample Project Label List
- Create a Label in this project GitLab 101 ABM Sample Project

Issue

The issue in GitLab is the fundamental planning object. It is where the team documents the use case in the description, discusses the approach, estimates the size/effort (issue weight), tracks actual time/effort, assigns work, and tracks progress. Labels enable the team to tag issues, track status, and associate issues with different initiatives. Issues are part of a Project

Issues Issues can have endless applications. For example, Issues can be used to; Discuss the implementation of a new idea, Submit feature proposals, Ask questions, Report bugs and so on.

Issues in Action: Common Use Cases

Issues are appropriate for almost any type of interaction or request-feature suggestions, bug reports, general discussions, and more. Whatever an Issue's purpose, to use it effectively, the author must communicate two things:

- The intended audience
- The information necessary to allow the audience to respond asynchronously

The exercises below provide best practices for communicating both.

Hands on: Create an Ad Hoc Issue

Since Issues live in Projects, the first step to creating an issue is locating the appropriate Project for your topic and audience. In this example, we'll be creating an ad hoc, free-text issue, asking a question of the Account Based Marketing Team in the GitLab101: Account Based Marketing Sample Project. To create the Issue:

- Visit the main Project page.
- Click the Issues link in the left-hand nav to view the Issues List.
- Click the green New Issue button in the top-right corner of the screen.
- Add a Title that summarizes your question or comment
- Type your comment or question in the Description field, as you would an email. The field supports Markdown, which you can preview as you type.
- You can @mention stakeholders or other interested parties to send them notifications and To-Do list items from this Issue. For this exercise, @mention yourself, to avoid spamming your coworkers with a test message.
- Assign the issue to yourself. This issue will now be linked to your current Issue list, accessible by clicking the Issues icon at the right corner of the purple toolbar at the top of the page.
- IMPORTANT: Due to our Transparency value, the default View setting for Issues is public. If your issue contains customer information or other sensitive data, check the checkbox next to "This issue is confidential and should only be visible to team members with at least Reporter

access."

- Click the green "Submit Issue" link.

Congratulations! You've just created an issue. You should receive an email summarizing your Issue, and you can add to the Issue's conversation simply by replying to that email.

Commonly-used group Issue Boards include:

- Corporate Marketing
- Product and Solution Marketing / Product Marketing

Hands on: Create a Templated Issue

To minimize the amount of back-and-forth required to provide all necessary information for complex requests, Project owners have created Issue templates for the most common use cases. These templates provide a description of all necessary information and formatting to complete a request. In many cases, they also provide a checklist for the author to review before submitting.

When submitting a templated issue, please take the time to read the entire description and respond to any checkboxes ([]) before submitting.

For this exercise, we will create a Sales Enablement request using the Enablement template.

To request an Enablement session:

- Visit the Product Marketing Group page.
- Click the Issues link in the left-hand nav to view the Issues List.
- Click the green New Issue button in the top-right corner of the screen.
- Select Enablement from the Template drop-down menu and click the orange Apply Template button.
- Fill out details in each section (for example, "Learning Objectives / Key points") as completely as you can, adding additional items or removing unused bullets as necessary.
- Identify stakeholders and other interested parties using @mentions as in the previous exercise.
- Add a Due Date if you have one. This does not guarantee that work will be delivered by this date, but it adds context for the Project owner who receives and triages this request.
- Do not remove or modify the /label code at the bottom of the issue. This will assign appropriate Labels to ensure proper routing.
- Do not assign the issue. This will delay the processing of your request. Each Group within Product and Solution Marketing has a process to triage and assign issues.
- Since this is an active project, DO NOT click the green Submit Issue button unless you are actually requesting an Enablement session.

Other common templated use cases include:

Requesting Assets

- Case Studies: Create a new issue in the Corporate Marketing Group and apply the CustomerStoryKickoff template.

- New Content / Collateral (e.g., white papers): Create a new issue in the Corporate Marketing Group and apply the content-resource-request template.
- Swag: Create a new issue in the Corporate Marketing Group and apply the BulkSwagRequest template.

Requesting People

- Technical Evangelist support: Create a new issue in the Corporate Marketing Group and apply the technical-evangelist-request template.

Requesting Event Sponsorship / Support

- Event sponsorship: Create a new issue in the Corporate Marketing Group and apply the Corporate-Event-Request template.
- Virtual event sponsorship: Create a new issue in the Corporate Marketing Group and apply the VirtualSponsoredEvent template.

Account Support and Access

For common licensing, customer access, and technical support issues, please visit the handbook's Internal Support page for access to the appropriate issue templates.

Boards

Boards provide a flexible and dynamic approach to visually manage a project. Boards make it easy for a team to create lists and move issues from one list to another. List on the board can be defined by a label, assignment, or milestone. Here, teams can manage their backlog of work, prioritize the items, and then move the issues to the team or specific stage in the project. Each list in the board calculates the total size (weights) of the associated issues, enabling the team to understand how much work is assigned at any given time. Boards are available for EITHER Group or Project

Project Issue Boards The GitLab Issue Board is a software project management tool used to plan, organize, and visualize a workflow for a feature or product release. It can be used as a Kanban or a Scrum board. It provides perfect pairing between issue tracking and project management, keeping everything in the same place, so that you don't need to jump between different platforms to organize your workflow. With GitLab Issue Boards, you organize your issues in lists that correspond to their assigned labels, visualizing issues designed as cards throughout that lists.

The group level issue board makes it possible for oversight and governance of the projects and sub groups. This view, makes it easy to see how specific issues are flowing through the lifecycle and to understand the overall
