Key Value at different tiers {tier-value}

Value at Premium

As organizations get started and grow in their automation journey, GitLab Premium offers Faster Code Reviews, Advanced CI/CD, Release Controls and Self-managed reliability with expert support to enhance team productivity and collaboration. GitLab Premium adds enterprise level features like priority support, upgrade assistance and a technical account managers (for eligible accounts).

For up-to-date and full list of value at Premium, visit [Why Premium](#). Some key features include (based on highest Post Purchase Survey Results):

- Faster code reviews Ensure high code quality across teams through seamless code review workflows
 - Multiple approvers in code review To ensure strict code review, you can require a minimum number of users to approve of a merge request before it is able to be merged.
 - Code Owners Assign Code Owners to files to indicate the team members responsible for code in your project. Code owners are assigned automatically as merge request approvers.
 - Code Review Analytics Find bottlenecks in your code review process by understanding how long open merge requests have been in review.
- Advanced CI/CD Build, maintain, deploy, and monitor complex pipelines
 - CI/CD Pipelines Dashboard Visualize the history and current status of pipelines across projects and groups all in a single dashboard that can be customized for each user.
 - Multi-project pipeline graphs Visualize how pipelines across projects are linked together, including cross project dependencies.
 - Merge Trains Reduce pipeline queueing and waiting time with merge trains which allows parallel pipeline execution, with each pipeline building off the merge result of the previous one.
 - CI/CD for external repo Connect your projects hosted on external services (like GitHub or Bitbucket) and leverage the power of GitLab CI/CD pipelines to build, test, and deploy your applications easily.
- Release Controls Implement controls to ensure teams ship high quality and secure code
 - Approval rules for code review Approval rules ensure that the right people review merge requests by specifying eligible approvers and the minimum number of approvals required for a merge request.
 - Required Merge Request Approvals Guarantee quality and standards of your code by mandating a set number of necessary approvals and predefine a list of specific approvers.
 - Merge Request Dependencies Coordinate the order in which merge requests are merged within the same project and/or across different projects.
 - Push rules Reject new code and commits that don't comply with company policy.
- Self Managed Reliability Ensure disaster recovery, high availability and load balancing of your self-managed deployment
 - Disaster Recovery Fail over in minutes to another data-center.
 - Maintenance mode Maintenance mode allows systems administrators to perform maintenance operations, such as preparing for a scheduled failover, with minimal disruption to end users.
 - Fault-tolerant Git storage with Gitaly Configure replicated Git storage with automatic failover, strong consistency, and read distribution for improved fault tolerance and

performance.

Value at Ultimate

Most of the value of the Automated Software Delivery Solution is available to customers at the GitLab Premium tier. GitLab Ultimate adds Security, Compliance, Portfolio and Value Stream Management - which are covered by other solution areas.

For up-to-date list of value at Ultimate, visit [Why Premium](#).

Customer Stories {customer-stories}

Company	Problem	Solution	Result
Goldman Sachs	Needed to increase developer efficiency & software quality	GitLab Premium (CI/CD, SCM)	Improved 2 builds/day to 1000+/day; simplified workflow & administration
Sopra Steria	Needed to standardize a tool for DevOps with single authorization	GitLab Premium (CI/CD, SCM)	Less than 6 minute builds, deploying to AWS, GCP, Azure
Wag!	Slow release process taking over 40 minutes	GitLab Ultimate (CI, CD)	Release process reduced to 6 minutes; 8 releases per day with built-in security; a full deployment pipeline to Amazon Elastic Container Service (ECS)
ANWB	Prolonged outages, long time to debug toolset integrations	GitLab Premium (CI, CD)	Setup for cloud transformation - Google Cloud on K8S
Ticketmaster	Slow build process prevented innovation	GitLab Premium (CI)	15x faster - from over 2 hours to 8 minute builds; faster releases and better customer experiences (5 star app reviews)
Hotjar	Legacy systems, maintenance of tool integration, slow adoption of cloud technologies	GitLab Premium (CI, CD)	50% faster deployments, 30% faster build times, 2-15 deploys per day
Paessler	Large complex pipelines, slow feedback loop	GitLab Premium (CI, CD)	75% faster build times, testing from 45 min to 15 min

Services {services}

GitLab Professional Services help customers become efficient in GitLab quickly. GitLab (or a GitLab partner) offers a number of service offerings to support customers.

Here are some service offerings you can position with the customer:

1. GitLab CI/CD Training
1. GitLab with Git Basics Training
1. Data Migration Services
1. Dedicated Engineering

Advisory/Consulting services to help with GitOps rollout are planned to be rolled out later this year. Please register your interest for a GitOps Advisory offering here to help PS effectively prioritize!

As you position services, you can use our Services Pitch Deck to help establish the value of engaging with PS. Other services can be found in our Complete list of professional service offerings

Talk with @em in the professional services slack channel to learn more.

The Market Viewpoint

The landscape of software development is changing. Today's users expect to interact with

software applications that are always-on and accessible from every device. To keep up, businesses of all sizes that have traditionally built and managed centralized, monolithic applications are shifting to distributed cloud services. And these services are being built and run by distributed teams located all around the world. Modernizing the business through IT is a cultural and technological shift.

With all of this complexity, software teams need DevOps tooling that works together with their cloud infrastructure to enable them to become faster and more efficient, while staying secure and reliable.

Modern Trends Impacting Software Development

- GitOps for modern infrastructure automation,
- Business emphasis on improving developer experience to attract and retain the best talent and improve productivity.
- Hybrid and multicloud
- Cloud native application architectures and legacy application modernization
- Digital Transformation
- Platform Modernization
- Accelerate App Dev & Delivery
- Developing App on Edge

Personas

User Persona

Sam, the SRE: Sam is responsible for the uptime and reliability of the application software running on the cloud infrastructure. He interfaces with Google Cloud services directly to meet his SLA (Service Level Agreements) and SLOs (Service Level Objectives). He can work on a dedicated team of SREs or be embedded into a product/service team with developers.

Devon, the DevOps Engineer: Devon is often the Ops interface for the development team. He provides support for infrastructure, environments and integrations. Devon is fairly conversant with code and would prefer administering infrastructure via code rather than a multitude of different tools and context switches.

Priyanka, the Platform Operator: Infrastructure management is one of the main responsibilities of the platform team. Priyanka is responsible for providing, maintaining, and operating a shared platform - either traditional or modern cloud platform - which the development teams utilize to ship and operate software more quickly.

Sydney, the System Administrator: Sydney defines, maintains and scales the infrastructure and configuration for the application teams. She often receives repetitive requests on the same task. Sydney's primary motivation is to automate repetitive tasks to minimize errors and save time as well as define the infrastructure and configuration in a way that changes are tracked and to stop infrastructure changes becoming the wild west.

Buyer Personas

Infrastructure Engineering Director, Kennedy

The Infrastructure Engineering Director is responsible for building and scaling highly available environments. They frequently have the agenda of cloud initiatives and cost optimization in the organization.

Release and Change Management Director, Casey

The Release and Change Management Director is responsible for managing complex releases from concept to delivery. The CIO may be the final decision maker or buyer, but the Release and Change Management Director has significant influence in the buying process.

The GitLab Solution

Messaging and Positioning

Positioning Statement

As DevOps maturity expands, software teams are looking for solutions that unify software lifecycle from planing and development to delivery and operation. Today's market is filled with siloed tools that either aren't designed to work with cloud infrastructure or are too tightly coupled to cloud providers other than Google Cloud. Businesses choose Google Cloud for their expansive fiber network, cost efficiency, and advanced capabilities such as ML and Kubernetes. GitLab and Google Cloud have partnered to bring unified solutions with tight technical integrations gives teams confidence in a seamless experience.

GitLab and Google Cloud work better together in several ways. You can install your Self-managed instance of GitLab and GitLab Runners on Google Cloud infrastructure. You can also use GitLab CI/CD to deploy your software to Google Cloud infrastructure using either a Self-managed GitLab instance, or GitLab.com, GitLab's SaaS service (which also runs on Google Cloud.) From Anthos and Cloud Run to Compute Engine and Kuberentes Engine, GitLab works great with an array of Google Cloud services. See the full set of GitLab joint solution capabilities with Google Cloud at <https://about.gitlab.com/gcp>

Short Description

GitLab and Google Cloud provide unified solutions to develop, deliver, and operate modern software applications with speed, efficiency, and reliability.

Long Description

GitLab is a complete DevOps platform, delivered as a single application. Google Cloud provides cloud computing services such as Anthos, Cloud Run, and Google Kubernetes Engine. Together, GitLab and Google Cloud provide unified solutions to develop, deliver, and operate modern software applications with speed, efficiency, and reliability.

From modernizing legacy applications to cloud native architectures using containers, service mesh and microservices, to operating complex distributed applications using GitOps you can trust GitLab and Google Cloud to meet your business challenges head on.

See the full set of GitLab joint solution capabilities with Google Cloud at <https://about.gitlab.com/gcp>

The Market Viewpoint

Incident Management

Downtime is expensive. The cost of downtime also compounds because customers lose trust every time your product is not available or is unreliable. It behooves organizations to not just build resilient applications that are available 24x7, but also enable an incident response capability that is efficient and reliable.

Because downtime is expensive. There is high pressure for the team responsible for incident management. When the team lacks the right tools to respond to incidents, their jobs become unnecessarily stressful and burn-out occurs. This snowballs into more outages leading to poor business outcomes.

Incident Management is a critical tool in your DevOps toolbox. The right incident management tool helps incident responders to be notified, streamlines communication and coordination, assists in diagnosing problems, facilitates remediation, and helps your entire organization to learn and to improve.

Personas

User Persona

- Devon the DevOps Engineer
- Allison in Application Ops
- Priyanka the Platform Engineer

Buyer Personas

Buyers are going to be Senior Managers or Directors of engineering, infrastructure, operations, or reliability teams. They typically lead 10-100 people depending on the set up of the company.

Industry Analyst Resources

Incident Management is frequently referred to as Incident Response from the analyst perspective. Sometimes it is categorized under ITSM (IT Service Management)

- Gartner
- Forrester
- 451

Market Requirements

Integrate alerting sources

Ability to integrate with any alerting source and consume alerts for IT service disruptions or outages. Alerts can be received in HTTP or email formats. Often tools will provide proprietary

- Typical features
 - Integrate via HTTP
 - Integrate via Email
 - Proprietary integrations with popular monitoring tools
 - View credentials for integrations
 - Ability to reset auth tokens
- Value: Aggregate alerts from all sources saving the response team time because they have a single tool to check when something goes wrong.

Alert Triage

All incoming alerts are aggregated in a list to streamline triage. Each alert has a detail page that shows the payload and an audit trail of actions taken on the alert. The status of an alert can be changed to show state and progress and alerts can be assigned to demonstrate ownership.

- Typical features
 - List of alerts that shows high-level details
 - Alert payload
 - Links to metrics and logs
 - Ability to change status
 - Ability to assign an alert

- Audit trails showing actions taken on alerts
- Value: Notification from monitoring tool that there is a problem. Provide details on service outage or disruption to aid the responder in starting their investigation.

Incident Response

All incidents are aggregated in a list to streamline triage. They also show up in Issue lists and on issue boards to fit the unique workflows of different teams. Incidents can be created manually or automatically from an alert. When an incident is created from an alert, it contains all of the alerts details. Incidents coordinate response and collaboration.

- Typical features
 - Link to originating alert
 - Alert payload
 - Description
 - Timeline
 - Discussion
 - Ability to assign
 - Ability to set severity
 - Slack integration
- Value: Coordinate response workflows by providing a SSOT for collaboration, communicating with stakeholders, and collecting findings

On-call Schedule Management

Set-up schedules for responding on-call. Admins have flexible options for creating schedules and adding responders to the schedules. Schedules are used in Escalation policies to identify who is on-call when an alert is triggered. Responders get to set up paging policies with preferred paging methods.

- Typical features
 - Rotations
 - Escalation Policies
 - Schedules Overrides
 - Personal paging policies
- Value: Provide peace of mind to response teams that critical alerts and incidents will reach the right person at the right time. Help teams distribute and rotate on-call responsibilities which is a very stressful job.

Post Incident Review

Review what happened during a fire-fight in a blameless setting. Walk through the incident timeline and notate it with learnings, places to improve, and things to investigate. Create after action items to continuously improve.

- Typical features
 - Create post incident review linked to incident
 - Ability to annotate incident timeline
 - Create after action items
- Value: Facilitate post incident review to help build a blameless culture focused on continuous

improvement and documentation.

The GitLab Solution

How GitLab Meets the Market Requirements

| Market Requirements | How GitLab Delivers Today | Demos |

| ----- | ----- | ----- |

|Integrate alerting sources | We offer the ability to create HTTP endpoints for customers to send alert to. We offer a proprietary Prometheus integrations that receives alerts from AlertManager | TBD |

|Alert Triage|Users can triage alerts in the alerts list with column sorting capabilities to filter to the most important ones. Clicking on an alert takes the user to the alert details where the user can view the payload, change the status, and assign it to someone. All actions taken on the alert appear as a system note in the audit trail for the alert.|TBD|

|Incident Response|Users can create incident manually or set up a project to have them created automatically for all alerts that are created in GitLab. Incidents contain alert details, an editable description, and comments so users can collaborate during a fire fight. A user can promote the incident to an externally facing status page to communicate with external stakeholders.|TBD|

|On-call schedule management|On-call schedule management MVC is planned to release in 13.10. The MVC will enable users to create a single schedule in a project that contains multiple rotations. All alerts received to that project will email the on-call responder in the scehdule.|TBD|

|Post Incident Review|Users can create an issue and link it to a closed Incident to execute the Post Incident Review. After action items can be created as additional issues.|TBD|

Top 3 Differentiators and Key Features

| Differentiator | Value | Proof Point |

|-----|-----|-----|

| On-call schedule management integrated with your dev platform | Easily transition your development to being on-call for the code that they write | TBD |

| Triage alerts and incidents in the same platform where you will deploy the fix |Shorten time to resolution. Easily associate incidents and patches + after actions items |TBD|

Competitive Comparison

|Competitor|Market Position|Strengths|Weaknesses|

|-----|-----|-----|-----|

|PagerDuty|Stand-alone incident management tool. Entrenched in the enterprise. We are starting to see them lose their foothold as the market shifts towards workflow tools including incident management versus companies relying on one specific tool.|Came into market on the right wave. Has a large customer base that is entrenched in the tool and it is hard to get a company to switch incident management platforms. Robust feature set. Cloud based HA solution.|Considered very expensive. Stand alone tool that does nothing else. Must be integrated with everything. Has a rap for poor customer service/success.|

|Opsgenie|Part of the Atlassian product suite - acquired in 2018. Less market share than PagerDuty - we rarely hear of GitLab customers using it. Considered "more progressive". One example of an Incident Management company becoming an offering of a workflow tool.|Very

flexible tool with an intuitive interface. Strong brand.|TBD|

|ServiceNow|Huge workflow tool that is entrenched in the enterprise. Has been slowly developing out-of-the-box incident management workflows for the last several years. Leans towards enabling traditional ITSM/ITL workflows.|Very flexible tool that offers users options to customize everything. Can easily expand to on-call teams because it is likely being used in other parts of the business.|Requires a lot of set up. People are not going to purchase it just for Incident Management. Lacks Incident Management specialized experience and features.|

|Splunk On-call|Formed by the VictorOps acquisition in 2018. Rebranded to Splunk On-call at the end of 2020. Is one part of three that makes up the Splunk Observability suite. Has a small marketshare.|VictorOps & Splunk have a very strong brand and a following. |Splunk has divested in Splunk on-call and reduced team responsible for it. Users are not going to purchase Splunk just for Splunk on-call. Splunk itself is very expensive. Tool is inflexible and is difficult for large teams to use.|

|Xmatters|

|DataDog Incident Management|A relatively new addition to DataDog's observability platform, introduced in 2020.|It has the advantage of having monitoring and incident response all housed within one integrated application. DataDog is a market leader in the Monitoring space and has a large pre-existing customer base to expand into. |Relatively new. Does not have on-call schedule management meaning that someone would also need an incident management tool to use it. Is proprietary to DataDog. |

Enablement & Training

Use Cases

This table shows the recommended use cases to adopt, links to product documentation, the respective subscription tier for the use case, and product analytics metrics.

Use Case	Description	Links to documentation	Applicable Subscription Tier	Metrics
-----	-----	-----	-----	-----
SRE team	This is a team of 10-30 people at a progressive company. In addition to responding on-call to incidents, they are involved in the architecture and maintenance of the infrastructure of the cloud-native services their company provides. They are agile and effective. They are committed to continuous improvement and have post-incident reviews built into their regular practices. They evangelize DevOps throughout their organization. They try to automate as much of their workflows as possible. This type of team will be the ones submitting the most feature requests and really pushing us (GitLab) to be more innovative. Ultimate TBD			
Development team	This team can range from 10-500 people. This is a team of engineers who are responsible for developing the software. They have recently been asked to be on-call as their organization moves through the DevOps transformation. They will rarely solve an incident themselves, they are much more likely to be paged to join a fire-fight with operations team members. More progressive organizations will have figured out a way to page engineers based on the area of the code-base they contribute to. In these teams it is common to find a lot of single points of failure (i.e. Senior team members that has a lot of domain knowledge) Premium, Ultimate TBD			
Support team	This team is typically 5-20 people and usually belongs to a much larger Support department. Support teams are reactive to customer reported outages and are the liaison between the company and the customer during a fire-fight. They handle stakeholder communication. We find these teams as traditional and progressive companies alike. Support teams are going to be satisfied with a "just-good-enough" solution. Premium, Ultimate TBD			

Discovery Questions

Question - What tools are you using for Incident Management today?

- Answer: "Home-grown. We built and maintain our own solution."
- Response and Follow-up Questions: Wow! Seems like a lot of work to create and maintain. Tell me about your system.
- Things to listen for: Maintenance is time consuming and unreliable, we couldn't afford a real tool.

-OR-

- Answer: "We use PagerDuty/Opsgenie/ServiceNow."
- Response and Follow-up Questions: Tell me about your experience using that tool.
- Things to listen for: It's expensive, we are using the free or cheapest tier, customer support is poor, it is missing feature X.

Daniel Hom (@danielhom)	Itzik Gan-Baruch (@iganbaruch)	Tim Rizzi (@trizzi)

The Market Viewpoint

Artifact management

As an Admin at a large, enterprise organization you need to enable your developers to point their tools like Maven, npm, or pip at a local proxy server for all of the dependencies that they need. The server must be able to fetch dependencies from remote repositories, cache the

artifacts, and be able to export its database of them to an air-gapped system at a regular interval. You need the ability to easily apply policies when dependencies are initially downloaded either scanning them for security vulnerabilities or applying some other selection criteria (allowable license, allowable package author, etc.).

Well the air-gapped requirement might be a bit much, the above is what I typically hear from our customers. You can just as easily add in requirements like geo-replication, high-availability, and auditing. If you are a large organization, you need help with artifact management. Why large organizations? Well, smaller development teams can typically work with the myriad of artifact management solutions out there because they likely:

- Only pull packages from public repositories like Maven Central
- Only have projects in one or two programming languages
- The developers can manage shared config files that handle how packages are downloaded and from where

For large organizations:

- You likely have projects in many different programming languages, including some you've probably forgotten about.
- Since you have many developers, it's hard to manage the various configuration files needed to securely manage how and where dependencies are downloaded from.
- You likely have much stricter compliance requirements.
- You may have team members spread out across the globe and you need download times to be fast and reliable from anywhere.
- You may have several affiliate companies or vendors that you'd like to give access to read or publish packages.
- You need to know who is downloading packages, how often and if there is any suspicious activity. (This probably can be stated under compliance)

I guess you can surmise from reading the above that the problem of artifact management is tough for large, complex organizations. So, why make it harder by spending more money on additional tools. The trend towards consolidation make sense. It's why companies like JFrog and Sonatype have been striving to expand their products from universal artifact managers to complete DevOps platforms.

GitLab can save you money and time with the GitLab Artifact Management offering. In the below article, we'd like to walk you through the requirements of an artifact management tool, how GitLab compares to the competition, and how you should evaluate vendors.

Personas

The personas for this use case are going to focus on large, complex organizations that need a tool for securely managing dependencies in a variety of formats from many different sources.

User personas

Today

1. · Sasha - Software Developer

- 1. · Devon - DevOps Engineer
- 1. · Priyanka - Platform Engineer
- 1. · Simone - Software Engineer in Test
- 1. · Delaney - Development Team Lead
- 1. · Rachel - Release Manager
- 1. · Central IT / System Admins

Medium Term (1-2 years)

As we execute our 3-year strategy, our medium term (1-2 year) goal is to provide a single application that enables collaboration between cloud native development and platform teams.

- 1. · Priyanka - Platform Engineer
- 1. · Sasha - Software Developer
- 1. · Devon - DevOps Engineer
- 1. · Allison - Application Ops
- 1. · Simone - Software Engineer in Test
- 1. · Delaney - Development Team Lead
- 1. · Rachel - Release Manager
- 1. · Ops Teams
- 1. · Central IT / System Admins

Software Developer Sacha

Software developers have expertise in all sorts of development tools and programming languages; an invaluable skillset to help ensure usability and consistency throughout the entire application development process and software development ecosystem while managing packages, storing and distributing images, and more.

- Developers are problem solvers, critical thinkers, and love to learn. They work best on planned tasks and want to spend a majority of their time creating value that's delivered to customers in the form of lovable features.

DevOps Engineer Devon

DevOps Engineers have a deep understanding of their organization's SDLC and provide support for infrastructure, environments, and integrations.

- DevOps engineers strive to make their daily life a little bit easier every day by automating everything.

Market Requirements

Market Requirement	Description
-----	-----
1) Package Registry	The GitLab Package Registry acts as a private or public registry for a variety of common package managers. You can publish and share packages, which can be easily consumed as a dependency in downstream projects.
2) Container registry	A highly scalable application that stores and lets you distribute Docker images.

3) API	An API for all features is required for supporting your customer workflows.	
4) Storage management	Dependencies can build up fast. You need a way to manage storage costs.	
5) Extensive metadata	Dependency metadata is required to validate you are using the correct one.	
6) Dependency scanning	Automatically find security vulnerabilities in your dependencies while you're developing and testing your applications.	
7) Dependency firewall	Prevent the introduction of security vulnerabilities from external dependencies	
8) Virtual registries	A collection of local, remote, and other virtual repositories accessed through a single logical URL. This hides the access details of the underlying repositories letting users work with a single, well-known URL.	
9) High availability	A highly available product will ensure your teams stay productive	
10) Geo replication	You can set up a Docker Registry on your secondary Geo site that mirrors the one on the primary Geo site.	
11) Searchable dependencies	It should be easy to search for and discover dependencies.	
12) Certified dependencies (or images)	Protect important dependencies from being corrupted or overridden.	

Adoption Guide

The following section provides resources to help CSMs lead capabilities adoption, but can also be used for prospects or customers interested in adopting GitLab stages and categories.

Playbook Steps

1. Ask Discovery Questions to identify customer need.
2. Complete the deeper dive discovery sharing demo, proof points, value positioning, etc.
3. Agree to adoption roadmap, timeline and change management plans, offering relevant services (as needed) and updating the success plan (as appropriate)
4. Lead the adoption plan with the customer, enabling teams and tracking progress through engagement and/or product analytics data showing use case adoption

Adoption Recommendation

This table shows the recommended use cases to adopt, links to product documentation, the respective subscription tier for the use case, and product analytics metrics.

Feature / Use Case	F	Product Analytics	Notes
-----	---	-----	----
Enable container registry across instance	x	containerregistryenabled	The Container Registry is enabled by default, but it can be turned off by an Administrator or by adjusting the project's settings.
Publish packages to your project	x	counts.projectswithpackages	This metric looks at the number of projects with at least one package. (all formats) It can be used to get

a high-level overview of adoption amongst an organization. |

| Publish packages to your project | x | counts.monthly.packages | This metric measures the total number of packages (all formats) published monthly. It can be used directionally to understand if adoption is growing or shrinking. |

| Publish packages to your project | x | redishllcounters.userpackages.userpackagestotaluniquecounts.monthly | This metric measures the total number of users (all formats) that published a package in a given month. |

| Publish packages using a Deploy Token | x | counts.packageevents.ipackagepush.packageby.deploy.token | This metric measures the monthly number of packages published using a Deploy Token. This important metric signifies that adoption of the Package Registry has matured into the customers' production workflows. |

| Pull packages as a Guest | x | counts.packageevents.ipackagepull.packageby.guest | This metric measures the monthly number of packages downloaded by a Guest user. This metric signifies broader adoption as well. As it means that several different teams and projects are consuming packages. |

| Publish npm packages | x | redishllcounters.userpackages.ipackagenpm.user.monthly | This metric measures the monthly number of users publishing npm packages |

| Publish Maven packages | x | redishllcounters.userpackages.ipackagemaven.user.monthly | This metric measures the monthly number of users publishing Maven packages |

| Publish PyPI packages | x | redishllcounters.userpackages.ipackagepypi.user.monthly | This metric measures the monthly number of users publishing PyPI packages |

| Publish Composer packages | x | redishllcounters.userpackages.ipackagecomposer.user.monthly | This metric measures the monthly number of users publishing Composer packages |

| Publish NuGet packages | x | redishllcounters.userpackages.ipackagenuget.user.monthly | This metric measures the monthly number of users publishing NuGet packages |

| Publish Generic packages | x | redishllcounters.userpackages.ipackagegeneric.user.monthly | This metric measures the monthly number of users publishing generic packages |

| Publish Conan packages | x | redishllcounters.userpackages.ipackageconan.user.monthly | This metric measures the monthly number of users publishing Conan packages |

| Publish Helm charts | x | redishllcounters.userpackages.ipackagehelm.user.monthly | This metric measures the monthly number of users publishing Helm charts |

Discovery Questions

- Are you using GitLab for CI?
- Do you currently containerize your apps?
 - If yes, what container registry are you using?
 - What percentage of your projects are building containers?
 - Which features are important to you in a container registry?
 - Do you have customized workflows or requirements?
 - What is working / not working about your current container registry?
- Do you package any libraries? Are you planning to?
 - What languages are you using?
 - Which features are important to you in a package registry?
 - What is working / not working about your current package registry?
- Do you want to provide public access to any of your containers or packages?

Additional Documentation Links

- Use CI/CD to build packages

- Build and push images using CI/CD
- Avoid Docker Hub rate limits with the Dependency Proxy

Enablement and Training

- Package roadmap review - March 2022
- Helm Chart repository demo
- How to host all your packages in a single project
- Fetch packages from npmjs.org when the package is not available in the GitLab NPM Registry
- Display more robust build data in the Package Registry
- Publish and share Composer dependencies
- Control access to the container registry
- How to remove Docker images using CI/CD (speedrun)
- Use the GitLab Dependency Proxy to proxy and cache images from DockerHub
- Conan Repository Demo

Frequent customer questions

1. Do you support the formats I need?
1. Can I pull dependencies from external sources? Are they cached?
1. Can I prevent dependencies with known vulnerabilities from ever being downloaded?
1. Can the dependencies be made available reliably for my organization? (multi-region, highly available, air-gapped)
1. OK, but we really rely on this, is it reliable?
1. Is it secure?
1. We have many terabytes of dependencies, can you handle that?
1. We have millions of downloads/uploads per day, can you handle that?
1. We also need the ability to audit the logs and know who/what/when/how packages have been uploaded or downloaded.
1. My organization destroys the current instance of GitLab before installing the new version. Are my packages backed up?
1. How the heck are we going to migrate our existing packages from vendor x to GitLab?
1. Beyond the migration, how are we going to update all of our pipelines and cookbooks.
1. I'm kind of a stickler Meseeks, how available is the product really?
1. Does it integrate easily with CI?
1. Can I manage storage easily?
1. I need to be able to make the repository private but the registry public?
1. I work for a center of excellences at a large organization, is there a way to put a big ol' badge on a dependency so the developers know what's available to them and pick the right dependencies.
1. Can you help me to avoid dependency confusion and typosquatting attacks?
1. Can you tell me how permissions work?
1. I want packages to be immutable objects, is that how GitLab works?
1. What about customer support?
1. Is it easy to get started?
1. Do the docs make sense?
1. What happens if the registry goes down?
1. Is anybody using GitLab's offering? Do they like it?
1. How should I tag things?
1. Is there an API?

1. Can I view packages and their build data?
1. Can I see when something has gone wrong?
1. Can I search for a package by name/version/type/description/commit/build/ really anything
1. Can I upload a package through the app?
1. Does the app warn me when a package is not compliant or contains a known vulnerability?

The Market Viewpoint

Agile Planning and Management

By empowering teams, embracing change, and focusing on delivering value, Agile methodologies have transformed software development. Agile teams create more relevant, valuable, customer-centric products, more quickly than ever.

Development teams accelerate the delivery of value with iterative, incremental, and lean project methodologies including Scrum, Kanban, Extreme Programming (XP), and more. Large enterprises have adopted Agile at enterprise scale through a variety of frameworks, including Scaled Agile Framework (SAFe), Spotify, Large Scale Scrum (LeSS), and others. GitLab enables teams to apply Agile practices and principles to organize and manage their work, whatever their chosen methodology. These new methodologies bring new challenges.

Agile is not a single methodology, but a set of guiding principles embraced by many methodologies in many ways. There is no single "best" way to plan and manage an Agile enterprise, and older project planning tools are often insufficiently flexible to address the needs of a given implementation.

This functionality gap leads to poor project estimation, planning, and progress tracking. Furthermore, Agile methodologies can create confusion between teams and throughout the enterprise, where even well-documented Agile processes may not map to traditional success metrics and waterfall financial planning.

Organizations need better ways to manage projects, programs, and portfolios using Agile. They need to better:

- plan and prioritize work based on strategic objectives
- initiate work
- monitor the progress of that work in progress
- collaborate on work, across teams, throughout the product lifecycle
- control and optimize the flow of work

- close work items when completed
- measure the value created by that work
- communicate that value throughout the organization, regardless of other methodologies in place

Market Leaders

GitLab

GitLab was named a 'Leader' by Gartner in their 2021 Magic Quadrant for Enterprise Agile Planning Tools after entering the report as a Visionary just two years prior and being a fairly recent entrant into the space.

Gartner, "Magic Quadrant for Enterprise Agile Planning Tools," Bill Bloesen, Mike West, Deacon D.K Wan, Akis Sklavounakis, Keith Mann, Wan Fui Chan, Hassan Ennaciri, April 20, 2021.

Gartner does not endorse any vendor, product or service depicted in our research publications, and does not advise technology users to select only those vendors with the highest ratings or other designation. Gartner research publications consist of the opinions of Gartner's research organization and should not be construed as statements of fact. Gartner disclaims all warranties, expressed or implied, with respect to this research, including any warranties of merchantability or fitness for a particular purpose.

Atlassian

Average annual revenue growth of 40% over the last five years, ~\$2B total revenue in 2020, and demand for remote working capabilities and SaaS during the global pandemic have propelled Atlassian (TEAM) to a \$84B market capitalization as of 08-17-2021.

Atlassian has consistently increased its market footprint through strategic acquisitions that would allow its complimentary products to organically self-propagate through enterprises. At its Remote Summit in April, 2020, Atlassian announced many new capabilities in Jira Align, based on their \$166 million acquisition of AgileCraft. AgileCraft, the company and the software, was a former market leader with support for SAFe and other enterprise Agile frameworks; it also featured strong support for teams using Atlassian Jira.

While Atlassian have many products, those most aligned with the Agile Use Case include Jira Software (Software Project Management), Jira Align (Portfolio Management), Confluence (Wiki), Trello (Project Management), Jira Core (Business Project Management), and Jira Service Desk (ITSM Software).

CollabNet VersionOne

In 2019, TPG Capital purchased CollabNet VersionOne from Vector Capital as part of TPG's \$500M equity capital investment to build an integrated DevOps company called Digital.ai, which in 2020 also includes XebiaLabs and Arxan Technologies. Digital.ai provides end-to-end solutions for Global 5,000 enterprises.

Agile planning tools VersionOne and Continuum support Scrum, Kanban, Extreme Programming (XP), and SAFe. Value stream management and portfolio management have been more of a focus, and

VersionOne is available as SaaS or on-prem. DevOps integrations include Jenkins, Chef, and others.

Broadcom Rally

As GitLab's Plan stage competitive landscape section describes:

> Rally was the de facto market leader at one point in time, but has seen its market share decline substantially. While it is still entrenched in many enterprises, many speculate that Broadcom has placed Rally on life support.

Rally is part of Broadcom's Digital BizOps Starter Edition and benefits from the company's larger presence, history, and product portfolio. Broadcom had acquired CA in 2018, for some time after which this product was still branded CA Agile Central.

Planview

Planview provides a range of enterprise grade project, product, and portfolio management capabilities. Lead by investments from Venture Partners in 2013 and Thoma Bravo in 2017, Planview has been steadily acquiring competitors such as Trough Technologies, Innotas, LeanKit, and Spigit to expand its reach into different markets.

The product, Planview Lean and Agile Delivery, is said to have strong support for SAFe, Kanban, and Scrum, with Kanban useful outside of software development including portfolio management and business strategy.

Apptio Targetprocess

On 02-11-2021, Apptio announced the acquisition of Targetprocess, one of the smaller and younger competitors in the plan space focused on PPM. Targetprocess has rapidly increased its market footprint and, like GitLab, has been recognized by Gartner as a leader in the EAPT market.

Microsoft

With the acquisition of GitHub, Microsoft has begun the process of combining features of the popular SCM solution with key features from Azure DevOps. Microsoft Project is their leading plan solution that currently owns 15-25% of the planning market.

ServiceNow

While they are an established vendor in IT service management, ServiceNow's Agile planning tool, the IT Business Management (ITBM) suite is said to have relatively basic functionality. ITBM includes release planning, limited SAFe support, and Jenkins integration, while its main advantage would be integration with the Now Platform and generally unifying development and operations backlogs via ServiceNow.

Trends

- From traditional project planning toward higher-level portfolio planning

- Increased importance of visibility and value stream management
- Increased interest in enterprise frameworks such as SAFe, LeSS, and the Spotify model
- Continued expansion of the Agile use case beyond software development
- Increased importance of coherence with compliance and business leadership
- Increased importance of Agile tools producing, integrating with, and being guided by data

SWOT Analysis

Strengths

- As a single DevOps Platform, GitLab allows organizations to plan and manage work in the same system where they perform it
- Our transparency and accordant willingness to be direct with, and meaningfully involve customers.
- GitLab's own modern but flexible software, from basis in Git to cloud integrations, positions us for the future and to be agile in our support of customers adopting Agile.
- The growth of DevOps is concurrent and may be symbiotic with that of Agile, and our reputation in DevOps precedes us.

Weaknesses

- GitLab's portfolio management capabilities are currently less mature than some more specialized competitive point solutions.
- Our MVC-based iterative approach to developing and deploying GitLab can initially jarring to prospective customers from more traditional, less Agile organizations.
- We're a relatively new player in the market.

Opportunities

GitLab is positioned for the future, with points including our ascendancy in DevOps, the trend toward platforms over DIY point solutions, our strength in DevOps for enterprise customers, and our own modern approach and architecture, optimized for cloud native applications. As a newer entrant to the space, GitLab is also unburdened by legacy code and processes and able to create a new Agile management paradigm that is more flexible and better-designed for coming changes in demand.

Threats

The mergers and acquisition landscape indicates that competitors are working on building or acquiring end-to-end platforms like GitLab, potentially mitigating against a key differentiator.

Larger players such as Microsoft and Atlassian have resources enabling them to close or open gaps quickly in Agile and adjacent areas.

As Agile becomes ever more mainstream, expansion may become more difficult per more stubborn shadow IT and resistance to change.

Personas

User Personas

With GitLab's unique capability to connect every phase of the Software Development Lifecycle in a single DevOps platform, many user personas find a solution in Integrated Agile Planning.

User personas and their key motivations for using GitLab for Agile planning include:

Parker the Product Manager

Parker the Product Manager

- PMs coordinate feature development and project success, along with general workload. Abilities to monitor progress through commits and the review app, and to validate those changes and provide feedback, are key to their success.
- Over time, changes generate valuable statistical insight for PMs to assess progress with product development and other projects.

Delaney the Development Team Lead

Delaney the Development Team Lead

- Like PMs, Team Leads need to understand their team's capacity to assign upcoming tasks and meet goals on time.

In consideration: personas from an Agile Planning perspective might include and be named as:

- Scrum Master
- Product owner
- Developer
- Tester/QA
- Project managers
- Product managers

Buyer Personas

Purchasing for Integrated Agile Planning may not require executive involvement, with one possible exception being the influence of the VP Application Development.

Erin the Application Development Executive (VP, etc.)

Erin the Application Development Executive (VP, etc.)

- Erin is a strategic leader focused on business challenges and the big picture.
- Erin's top goal is predictable business results.

Industry Analyst Resources

- Gartner, "Magic Quadrant for Enterprise Agile Planning Tools," Bill Bloesen, Mike West, Deacon D.K Wan, Akis Sklavounakis, Keith Mann, Wan Fui Chan, Hassan Ennaciri, April 20, 2021.

Market Requirements

Map business and portfolio plans to market opportunities

Requirement	Description	Typical features	Value
1.	Requirements modeling, management, and analysis	Describe necessary product behavior against which output can be validated. Epics, Features, Stories, Tasks, Health Status Reporting, and any necessary compliance to manage requirements for regulated industries Provides a common vision for the product's end state and an archive of scope changes throughout the development process, Ensures that value being delivered meets stated goals and necessary compliance.	
2.	Flexible workflow support	Enables events and workflows from popular Agile frameworks and custom Agile implementations Sprint planning, sprint retrospectives, customizable timeboxes, support for enterprise Agile frameworks such as SAFe and LeSS Increases productivity by reducing context switching, provides a single source of truth for onboarding, auditing, and reference, removes operational resistance to Agile adoption by working with existing methodologies.	
3.	Value Stream Management	Visualize an end-to-end workstream, identify and target waste and inefficiencies, and tune those workstreams to deliver the highest possible velocity of customer value. Custom workflow modeling and measurement, waste identification Provides an objective standard by which the effectiveness of efforts can be judged and identifies opportunities for high-impact efficiency improvements.	
4.	Role-specific interfaces	Interfaces that surface relevant information in a context suited to different users. Boards, roadmaps, dashboards Allows workers to inspect and interact with workflows without switching context from their primary work tools or sifting through information that is not necessary within their business context.	
5.	Actionability	Tactical participation in workstreams from any part of the management system Inline collaboration, drill-downs from dashboards into work items Closes the loop between ideation and iteration, allowing decision-makers to execute immediately and unblock value flows.	
6.	Traceability	Understand the history and context of every action Event logs, exceptions, approval-related conversations Provides an unimpeachable source of truth for audits and retrospectives, verifies that customer value was delivered as requested.	
7.	Quality metrics	Usability and value of outputs Test coverage, escape defect analysis, security vulnerabilities, license compliance Improve product value, identifies opportunities for training and process refinement, minimize adverse business and compliance impacts of changes.	
8.	Operational metrics	DevOps efficiency and success DORA4 metrics: Deployment Frequency, Lead Time, Cycle Time, Change Failure Rate Identify waste, optimize delivery of value	
9.	Organizational effectiveness metrics	Efficiency with which the organization collaborates to deliver customer value Team adoption of Agile processes, time tracking, financial / cost tracking and estimation Surfaces systemic process inefficiencies and opportunities for improvement.	

| 10. Integrations to external data sources | Provides visibility into and updating of external systems that contain data to management and planning | DevOps, financials, performance monitoring systems | Enables tracking of value that extends beyond scope of planning tool, storage of data in other systems for further analysis |

The GitLab Solution

How GitLab Meets the Market Requirements

| Market Requirements | How GitLab Delivers | GitLab Category | Demos |

| ----- | ----- | ----- | ----- |

| 1. Requirements modeling, management, and analysis | Allows users to set criteria against which they can validate products using requirements artifacts in GitLab that describe the specific behavior of a product. Requirements can be marked satisfied by a CI job, and if they are no longer needed, requirements can be archived. When a feature is no longer necessary, you can archive the related requirement. | Plan stage: Requirements Management | Requirements Management |

| 2. Flexible workflow support | Provides multiple methods of timeboxing work, allowing users to manage tactical work in Iterations while simultaneously managing strategic efforts across multiple iterations in Milestones. GitLab's ability to nest multiple levels of sub-Epics allows users to map to any necessary organizational structure, including those of enterprise frameworks such as SAFe. | Plan stage: Epics, Iterations, Milestones | |

| 3. Value Stream Management | Provides out-of-the-box Value Stream Analytics to automatically benchmark the DevOps lifecycle and identify inefficiencies. Allows users to define and measure their own custom lifecycle stages. Insights provides the ability to track and manage custom workflows using Scoped Labels. | Manage stage: Value Stream Analytics, Insights.
Plan stage: Scoped Labels | |

| 4. Role-specific interfaces | Offers a variety of interfaces aimed at role-based contexts, including Security Dashboards, Roadmaps, Value Stream Analytics, Group- and Project-level boards, and aggregation of all relevant information in the Merge Request. | Manage stage: Value Stream Analytics
Plan stage: Roadmaps, Boards
Secure stage: Security Dashboard. |

| 5. Actionability | Offers a single system for all work and complete traceability, from planning to collaboration to code changes and their impact on quality and performance. From any point in the application, GitLab users can always drill down into Issues and Merge Requests to collaborate. | Plan stage: Issues, Merge Requests | |

| 6. Traceability | All actions within GitLab are logged and surfaced in multiple contexts, allowing users to discover and reference historical data with minimal work. Merge Requests aggregate all related information, allowing users to view the collaboration leading to a code change, the impact of a code change, and all relevant collaboration that led to the change and its approval. | Manage stage: Project Import / Export
Plan stage: Merge Requests
Secure stage: Security Dashboard | |

| 7. Quality metrics | Run and view the output of automated tests in your CI pipelines to verify/validate code pre-production. Includes Unit tests, integration testing, browser performance testing, code quality, code coverage, usability testing, and accessibility testing.

Automatically scan license compliance on each commit. | Verify stage: CI, Code Quality, Code Testing and Coverage, Web Performance, Usability Testing, Accessibility Testing
Secure stage: License Compliance | |

| 8. Operational metrics | Value Stream Analytics provides insights into how efficiently your DevOps processes are running (including Deployment Frequency and Lead Time for Changes DORA metrics) and identifies opportunities for improvement. | Manage stage: DevOps Report | |

| 9. Organizational effectiveness metrics | The DevOps Report provides an overview of your entire instance's adoption of Concurrent DevOps, from planning to monitoring. | Manage stage: Value Stream Analytics | |

| 10. Integrations to external data sources | GitLab offers dozens of integrations and an open core model that encourages others to contribute. | Manage stage: Integrations | |

Top 3 Differentiators and Key Features

Differentiator	Value	Proof Point
End-to-End Visibility and Traceability	As a true DevOps Platform, GitLab ensures complete visibility and traceability from planning and collaboration through development, testing, delivery, and post-delivery monitoring, ensuring complete context to all participants and auditors	Deliver more value with fewer headaches using an end to end DevOps platform
Actionable Insights	As a single source of work across the development lifecycle, the GitLab DevOps Platform allows product stakeholders to move from insight to action in just a few clicks, discovering inefficiencies and resolving them in a single system, without context switching.	Deliver more value with fewer headaches using an end to end DevOps platform
Product Development Management	GitLab is the only product that provides collaboration capabilities to Product teams that works not only with source code but also IP, graphic assets, animations, binaries, and general project management issues. Forrester's Adopt Product Management to Connect Design and Development states "Siloed Design And Dev Teams Deliver Subpar Software"
