

Engineer, Gartner Peer Review

>

>"One of the best ways to approach source code management (Git) and release pipeline management [CI/CD]. [GitLab] gives you a simple yet highly customizable approach to release management which is a complicated topic."

>

> - System Engineer, Gartner Peer Review

>

>"The best software tool to manage all our projects and configure [CI/CD]. I will definitely recommend GitLab to everyone that wants to start a new project and doesn't want to use too many tools, GitLab has everything that you need to manage."

>

> - Web Developer, Gartner Peer Review

>

>"Over the years, we have successfully taken advantage of [GitLab's] continuous deployment and integration mechanisms to build [and] maintain a robust and solid codebase."

>

> - Co-Founder/CEO, Gartner Peer Review

>

>"One of the best [tools] for continuous integration and continuous deployment. "

>

> - Lead - Mobile Apps, Gartner Peer Review

>

>"Overall, the experience with GitLab is very positive, it provides many powerful features especially regarding Continuous Integration and [Continuous Deployment]"

>

> - Developer Analyst, Gartner Peer Review

>

>"[GitLab's] UI is so easy and manageable to understand. Built-in continuous integration is one of its best [features]."

>

> - Technical Evangelist, Gartner Peer Review

>

>"GitLab isn't just for hosting your code, it's for the entire lifecycle of your code. Since they host code, it makes sense for them to provide services around development and getting code into production. Their integration into other services is really easy. They give you GitLab-CI for any CI/CD needs, driven from a yaml file."

>

> - Testing Analyst, Gartner Peer Review

>

>"This is really an amazing source code repository toolset which enables the robust CI practices which are inbuilt features of GitLab. This can be utilized well in any enterprise looking for the smooth CI/CD pipelines."

>

> - Software Engineer, Gartner Peer Review

Blogs

Jaguar Land Rover

Jaguar Land Rover

- Problem: JLR had 6 week feedback loops resulting in slowdowns
- Solution: Premium (CI)
- Result: Feedback loops reduced to 30 mins. JLR is deploying within the engineering environment, 50-70 times per day of each individual piece of software to a target or to a vehicle.
- Sales Segment: Enterprise

Ticketmaster

Ticketmaster

- Problem: Long Jenkins build times slowed down CI pipeline
- Solution: Premium (CI)
- Result: Less than 8 minutes total from commit to build, test and generate artifacts
- Sales Segment: Enterprise

Case Studies

Goldman Sachs

Goldman Sachs

- Problem Needed to increase developer efficiency and software quality
 - Solution: GitLab Premium (CI/CD, SCM)
 - Result: Improved from 1 build every two weeks to over a 1000/day, or releasing 6 times per day per developer, and an average cycle time from branch to merge is now 30 minutes; simplified workflow and simplified administration
- All the new strategic pieces of 'software development platforms are tied into GitLab. GitLab is used as a complete ecosystem for development, source code control and reviews, builds, testing, QA, and production deployments.
- Sales Segment: Enterprise

Hotjar

Hotjar

- Problem Hotjar was looking to replace Jenkins and reduce complexity within their tool stack
- Solution: GitLab Silver (CI/CD)
- Result: Time of CI builds decreased by 30%, improved to 2-15 deploys per day, and 50% deployment time saved.
- Sales Segment: SMB

CERN

CERN

- Problem: CERN was looking for an open source way to host their pipelines
- Solution: GitLab Starter (CI)
- Result: The European-based particle physics laboratory, uses GitLab for more than 12,000 users and 120,000 CI jobs a month
- Sales Segment: Enterprise

Request reference calls by pressing the "Find Reference Accounts" button at the top of your stage 3 or later opportunity.

Adoption Guide

The following section provides resources to help CSMs lead capabilities adoption, but can also be used for prospects or customers interested in adopting GitLab stages and categories.

Playbook Steps

1. Ask Discovery Questions to identify customer need
2. Complete the deeper dive discovery sharing demo, proof points, value positioning, etc.
3. Deliver pipeline conversion workshop and user enablement example
4. Agree to adoption roadmap, timeline and change management plans, offering relevant services (as needed) and updating the success plan (as appropriate)
5. Lead the adoption plan with the customer, enabling teams and tracking progress through engagement and/or product analytics data showing use case adoption

Adoption Recommendation

This table shows the recommended features to adopt, links to product documentation, the respective subscription tier for the feature, and Service Ping metrics.

Feature	F	P	U	Service Ping metrics

Professional Service Offers

GitLab offers a variety of pre-packaged and custom services for our customers and partners. The following are service offers specific to this solution. For additional services, see the full service catalog.

- GitLab CI Training
- Jenkins Migration Services
- DevOps Fundamentals Training

Key Value (at tiers)

Premium

Why choose GitLab Premium for CI?

As you scale CI throughout your organization and onboard additional teams, GitLab Premium unlocks a faster path to value for any number of teams with expert support, advanced configurations, and consistent standards.

- Gain peace of mind: take advantage of enterprise level priority support, including 24/7 uptime support, a named Customer Success Manager (CSM), and upgrade assistance.
- Reliability and compliance: get the ability to audit logs, auditor users, and have an actionable disaster recovery strategy with support for High Availability.

Key features with Premium:

- Multi Project Pipelines- link CI pipelines from multiple projects.
- Operations dashboard- get a holistic view of the overall health of CI/CD pipelines and organization wide operations.
- Browser Performance Testing- detect performance regressions within your applications.
- CI/CD for external repositories- connect your external repositories instead of moving your entire existing project(s) to get the benefits of GitLab CI/CD. This feature supports GitHub, Bitbucket Cloud, and any other Git-based repository.

Ultimate

Why choose GitLab Ultimate for CI?

Achieve advanced DevOps maturity with executive visibility, deeper insights/analytics around usage, and additional capabilities to keep your environments secure and compliant across the board.

- Enterprise-grade priority support, including 24/7 uptime support, a named Customer Success Manager (CSM), and upgrade assistance are all still included with Gold/Ultime.

- Embed security and compliance into your CI Pipelines.
- Protect your IP and get access to free guest users.

Key features with Ultimate:

- Static Application Security Testing- check for potential security issues by evaluating static code.
- Dynamic Application Security Testing- analyze review applications to identify potential security issues.
- Dependency Scanning- evaluate third-party dependencies to identify potential security issues.
- Container Scanning- analyze Docker images and check for potential security issues.
- Security Dashboard- visualize security status for projects.
- License Compliance- identify the presence of new software licenses included in your project and track project dependencies. Approve or deny the inclusion of a specific license.
- Compliance Dashboard- gives you the ability to see your group's Merge Request activity by providing a high-level view for all projects in the group and approvers for a given Merge Request.

Context

As a refresher, Continuous Integration empowers developers to regularly integrate code changes in small batches so they can be automatically built and tested before being merged into production. It may sound obvious to take that approach but most modern application development involves a variety of programming languages and tools that run on different platforms that makes integrations more complex.

Thinking more broadly in terms of Continuous Integration and Continuous Delivery (referencing CI/CD together as one has become more common today), CI ensures software is automatically validated pre-deployment and ready for the next step in the application delivery process. CD acts as an extension of CI to automate the actual release process and gets software in a state where "it can be deployed to production at any time with the touch of a button," to reference Jez Humble's take on CD.

Below, you'll find messaging and positioning focused on the CI use case and GitLab's CI capabilities. Please feel free to provide input and help improve the content for future iterations. Everyone can contribute!

Messaging and Positioning

| Positioning Statement | For developers, development leads, and DevOps roles (managers/architects) investing in CI/CD: Using GitLab for CI eliminates your need to cobble together multiple DevOps tools and removes dependencies on manual or legacy development processes by providing powerful, scalable, end-to-end automation that development teams can easily adopt to get started with CI/CD quickly.

 GitLab CI/CD is built-in to GitLab's complete DevOps platform and delivered as a single application to ensure quality code gets to production faster with the help of automation in place of tedious, manual development work. GitLab helps bridge the gap between Dev and Ops, lessens disruption to normal workflows, and helps both groups work together more efficiently. |

|-----|-----|

| Short Description | CI with GitLab enables your teams to build high quality applications at-scale and speed up development through build automation, test automation, and developer

collaboration. |

| Long Description | Driving your company through a digital transformation comes with unique business demands. You need to replace manual work with automation as much as possible throughout the entire software delivery lifecycle (SDLC), making continuous integration a requirement for any business going digital. Your development teams can't afford to add more complexity to the DevOps toolchain they maintain, and you shouldn't have to invest in laborious, manual, development work to modify an existing CI implementation to fit modern needs.

 GitLab offers a purpose-built CI solution that maximizes development time: improve your productivity, increase efficiency, and streamline workflows through built-in automation, testing, and collaboration. |

| Key-Values | Efficiency
 Empower Dev and Ops to work better together | Collaboration
 Improve visibility and communication | Results
 Increase release velocity and ship reliable code |

|-----|-----|-----|-----|
-----|

| Promise | - Bridge the gap between Dev and Ops: no more "throwing things over the wall" halting progress means teams spend their time shipping features that customers love. | - Gain faster feedback and integrate smaller changes frequently to reduce the risk of build-breaking changes. | - Faster time to market and more reliable builds mean value gets into the hands of customers sooner with a high degree of confidence in quality. |

| Pain points | - Manual development work and legacy approval processes that are tedious, time consuming, and unenjoyable for both dev teams and ops teams involved.
 - Integrating different tools among multiple teams in different parts of the organization efficiently. | - Dealing with delivery bottlenecks, code breaking changes, and things like branch conflicts that are avoidable via effective collaboration.
 - Visibility into pipelines and ongoing work across the org. | - Committing large chunks of code changes that are harder to detect and fix errors.
 - Manual testing or maintenance tasks that take away from planned development time/work. |

| Why GitLab | - GitLab's built-in CI is powerful, yet flexible, enough help Dev and Ops be at their best and work as efficient as possible. Delivering CI as a single application helps to naturally break down development silos and scale safely. | - We embrace transparency and collaboration as core value propositions and weave these principles into everything we do. No one else can say this -- even our proprietary product is shared source. | - GitLab provides modern CI capabilities that "just work" as expected. We practice what we preach to better understand what obstacles customers face so we can provide the best solutions to overcome challenges with CI. We are dedicated to rapid innovation and release new features and capabilities monthly. |

| Proof points | - Goldman Sachs: improves from 1 CI feature branch build every two weeks to over a thousand per day.
 - Jaguar Land Rover embraces CI to speed up their software lifecycle.

Background info

What is GitLab Runner?

Suppose you're a developer or part of a team responsible for building, testing, and deploying your applications. In that case, GitLab Runner is the engine that enables you to run fast, scalable continuous integration pipelines on your on-premise infrastructure or the cloud. As the build agent that works in conjunction with GitLab CI/CD, the Runner executes your build and deployment jobs with minimal maintenance and overhead for your development teams.

GitLab Runner is one of the most feature-rich and flexible build agents. You can use GitLab.com hosted Runners or install the Runner on your on-premise Kubernetes clusters, RedHat OpenShift, Linux, macOS or Windows Servers, and IBM Z mainframes.

For those organizations hosting workloads on public clouds, you can install the Runner on virtual machines on any public cloud platform. For larger organizations, you can also take advantage of the Runner's autoscaling and fleet management capabilities on many cloud platforms, including Google Compute Engine, Microsoft Azure, Amazon Web Services, and Digital Ocean.

What does GitLab Runner do?

- Polls a GitLab instance for CI/CD jobs to execute.
- Automatically runs GitLab pipeline CI/CD jobs using a local shell or container.
- Can run multiple jobs in parallel.
- Sends the results of job execution and uploads job artifacts to your GitLab instance.
- Automatically scales new Runners on demand for cost-effective build agent autoscaling that actually works.
- Provides a secure job execution environment.
- Provides a configurable solution to address complex security or policy compliance requirements.

What does GitLab Runner Mean?

- Your day to day as a developer is easier and more productive.
- You reduce operational complexity
- Low maintenance CI/CD build platform.
- You get exceptional build speed and reliability
- Code gets to production faster and you can release more often
- Minimize downtime risk
- You can onboard new teams without friction

General messaging and positioning

Messaging

GitLab Runner is the multi-platform, autoscaling agent that can run GitLab CI/CD pipeline jobs on your on-premise infrastructure, on GitLab.com or a public cloud provider.

Run your jobs in an environment best suited to your team's workflows and needs, whether that is a Kubernetes cluster, a local shell, or Docker containers. You have the flexibility and control to solve your CI/CD process requirements with a simple to set up and operate, almost no

maintenance solution.

GitLab Runner is a shell-based execution engine that can take any script and run it.

If you can write it you can run it!

Runner headline promises

Options for marketing and web content.

Runner headline 1

GitLab Runner works alongside GitLab CI/CD to provide a quicker, easier, way to run jobs based on your specific runtime environment and hosting requirements.

Runner headline 2

Use GitLab Runner to orchestrate your CI/CD pipelines and optimize workflow execution at any scale.

Value Statements

GitLab Runner benefits

- Lightweight, simple workload execution
- Highly scalable
- Flexible hosting
- Straightforward configurations
- No hassle setup for easy adoption

GitLab Runner capabilities

- Flexible, efficient builds
 - Build parallelization to run multiple jobs concurrently
 - Run builds locally or in the cloud using Docker containers
 - Autoscale resources and provision runners on-demand
- Any language, any platform, any cloud
 - Runner is written in Go and distributed as a single binary without any other requirements.
 - Supports Bash and Windows PowerShell.
 - Works on GNU/Linux, macOS, and Windows (pretty much anywhere you can run Docker).
 - Allows for customization of the job running environment.
- Straightforward to adopt and scale as you onboard new teams
 - Easy to use and setup initially with support for Docker, Docker-SSH, Parallels, or SSH running environments.
 - Easy installation as a service for GNU/Linux, macOS, and Windows.

See a full list of Runner features)

How Runner works

- GitLab Runners can be installed almost anywhere, dedicated virtual machines (on-premise or public cloud), Kubernetes clusters, bare metal.
- GitLab Runner supports Docker containerization, so users can define a custom container environment to build, define, test and run their code.
- GitLab Runner implements different types of executors for running your builds for various use cases and scenarios. An executor refers to an environment or command processor on the host O/S that the Runner is able to use for running a job.
- GitLab and the Runners only communicate through an API using the https protocol, so the only requirement is that the Runner's host machine has network access to the GitLab instance. DevOps teams have the flexibility to deploy and host the Runner in a configuration such that all source code is always within the organization's network.

The Market Viewpoint

Data Science · AKA DataOps, MLOps, etc

Common challenges

Common challenges in data science are described on the Data Science with GitLab use case page and generally include being cross-functional, agile, and iterative while unlocking the value in an organization's data. To do this, data teams need to:

- Collaborate both inside and outside their teams, and often inside and outside their organization
- Plan and manage projects and sprints, with tools flexible enough to support scrum, kanban, and more
- Version control everything: manage and track different versions of files, models, test cases, data sets
- Automate key workflow steps, that are otherwise slow and subject to manual errors
- Streamline testing and validation of work, making it much faster and more repeatable
- Simplify infrastructure management and often across multiple cloud providers

To be fleshed out as with other use cases.

Analyst Coverage

Media coverage, 20 Feb. of Gartner's 2020 Magic Quadrant For Data Science And Machine Learning Platforms.

Internal to GitLab:

- EMA research on the impact of AI on DevOps in the enterprise
- Gartner on App Dev in the Era of AI, at App Summit
- Gartner on Git support as a baseline requirement in Data Science and Machine Learning Platforms see pages 4, 7-8

AR Plan: We will not have an AR Plan for this usecase, at this time. Generally, usecase AR plans provide key details on how we intend to engage with the analyst community.

Market Requirements

Capability	Description	Typical features enabling this capability	Value/ROI
-----	-----	-----	-----

| Data Science tools integrations | Solution supports strong integrations both upstream and downstream such as with ETL, data warehouses, artifact repositories, security scanning, compliance management, etc. There is flexibility for users who need or want a balance between native capabilities and integrations. | Particular need for Open Core and Open Source support including Git and Docker, Kubernetes, Jupyter Notebooks, Python and R, Hadoop and Spark. Integrations generally with binary repos, IDEs, APIs, third party libraries, or extensibility via plugins. | Increases efficiency. Lessens cost and the extra work that comes along with potential migrations. |

| Protect and secure assets | The solution provides mechanisms to host assets (repos), place and manage different change permissions for the users that access those repos as well as keep a detailed chain of custody of all changes these assets are subject of. | Single sign-on, code ownership, change reviews, change approvals, manage allowed IPs, Activity stream, GPG signed commit, Reject unsigned commits, Protected branches, branching, committer access rules, Compliance dashboard etc. | Secures IP and valuable assets. Provides information on project history changes |

| Supports numerous assets | The solution is able to manage and maintain the version history of the diverse assets and support the development patterns that each asset implies | Component reuse, traceability, design management, branching, diffing, merging, object storage, design versioning | Able to manage assets and files for the entire development team, no matter how diverse, creating a single source of truth for the product configuration and making visibility and communication available at every level |

| Foster Collaboration | The solution is designed to enable and foster collaboration among team members. It also streamlines agreed collaboration with automation of repetitive tasks | Create fast new branches of the project, add new files/assets, collaborate on proposed changes, review comments, suggest changes, webIDE, suggestion approvals, conflict resolution, merge, diffing, hand-offs, Design management and operations, workflow automation, Wiki, snippets, version controlled snippets, Automatically update or close related issue(s) when a merge request is merged, Configurable issue closing pattern, display merge request status for builds in CI system, visibility into security scans and build stats. | Code quality increase and improved release velocity through team review and validation. |

| Build and test automation | Streamlines application development workflow by connecting simple, repeatable, automated tasks into a series of interdependent automatic builds and associated tests. Run and manage automated tasks in the background, preview and validate changes before it's merged to production. Ensure software is consistently built and tested without manual intervention, enabling developers to get rapid feedback if their code changes introduce defects or vulnerabilities. Teams have control over where automated jobs run either in the cloud (public/private/hybrid) or using shared infrastructure. | CI/CD pipelines, scalable resources, job orchestration/work distribution, automated deployments, caching, external repository integrations, and the ability to run isolated, automated, tests (such as unit tests, regression tests, etc.). | Development teams can work with speed and efficiency. Catch potential errors sooner rather than later before they intensify. |

| Cloud-agnostic deploy and manage | asdf | asdf | asdf |

Top 3 Differentiators

Differentiator	Value	Proof Point
Leading SCM and CI in one application	GitLab enables streamlined code reviews and collaboration at proven enterprise scale, making development workflows easier to manage and minimizing context switching required between tools in complex DevOps toolchains. Users can	

release software faster and outpace the competition with the ability to quickly respond to changes in the market. | Forrester names GitLab among the leaders in Continuous Integration Tools in 2017, Alteryx uses GitLab to have code reviews, source control, CI, and CD all tied together. Axway overcomes legacy SCM and complex toolchain. |

| Open Source; Everyone Can Contribute | Open core development model allows anyone to contribute to the functionality of the product. Uniquely transparent product development process engaging customers, partners, and the community. Strong and growing community - thousands of organizations and millions of users. | Over 3,000 active community code contributors. Siemens needed to improve and enhance their developer tools, and actively contribute to GitLab project with upstream commits. |

| Deploy Your Software Anywhere | Deploy and manage your models in any environment, including any cloud with support for GCP, AWS, Azure, OpenShift, VMWare, On Prem, Bare Metal, etc. Gain workflow portability - one deployment workflow regardless of destination. Provides a complete DevOps platform that allows teams to have the same productivity metrics, governance, and other connective tissue, no matter what cloud they use. | Ask Media Group found it difficult to manage the process of building and deploying microservices. With GitLab Premium, their developers can immediately begin to contribute a new service that can be deployed to AWS as soon as they start. Gartner's 2019 Hype Cycle for Infrastructure and Operations Automation: GitLab helped to define the market, and is recognized as a relevant vendor for both Continuous Delivery and Toolchain Orchestration. |

SECTION: marketing/brand-and-product-marketing/product-and-solution-marketing/usecase-gtm/data-science/keywords.md

Keywords for data science

terms are linked to their Wikipedia articles

- data science: using scientific methods, algorithms, and systems to extract knowledge and insights from data
- decision science: for business problems, data science combined with behavioral science and design thinking to understand end users
- business intelligence (BI): analyzing and reporting historical data, like sales statistics and operational metrics, to guide strategic decision-making
- data analysis: inspecting, cleansing, transforming, and modeling data, with the goal of discovering useful information
- data mining: discovering patterns in data with methods and tools like machine learning, statistics, and database systems
- exploratory data analysis (EDA): summarizing a dataset's main characteristics and informing the development of more complex models or logical next steps
- data engineering: building infrastructure with which data are gathered, cleaned, stored, and

prepped for data science

- DataOps: automated, process-oriented methodologies to improve quality and reduce cycle time in data analytics · akin to DevOps for data, with these key differences
- artificial intelligence (AI): computer systems that can perform tasks that normally require human intelligence, using human reasoning as a model
- AIOps: DataOps at the intersection of AI and big data, often using machine learning with the intent to feed continuous insights into continuous improvement, and often including collaborative automation, performance monitoring, and event correlations
- machine learning (ML): A subset of AI in which a system learns from input by identifying patterns in that data, then applies those patterns to new problems or requests, allowing data scientists to teach a computer to carry out tasks rather than programming it step-by-step
- supervised learning: a subset of ML with a data scientist guiding or teaching the desired conclusion to the algorithm, such as a system learning to identify problems by being trained on a dataset of correctly labeled and characterized problems
- deep learning: advanced machine learning systems with multiple input/output layers, as opposed to shallow systems having one round of data input/output
- MLOps: akin to DevOps or DataOps, collaboration and communication between data scientists and operations professionals to manage the production ML lifecycle, with increased automation and improved quality per business and regulatory requirements

Keywords related to data science

terms are linked to their Wikipedia articles

- ETL (extract, transform, load): data integration from multiple sources, normalized or transformed into a common or standardized format, often to build a data warehouse
- data visualization (dataviz): visual representation of text-based information, to help recognize patterns, trends, and correlations and to generally understand the significance of data
- data model: defines how datasets are connected to each other and how they are processed and stored
- data warehouse: repository where all the data collected by an organization is stored and used as a guide for business decisions
- R): programming language for statistical computing, used by statisticians and data miners for data analysis and developing statistical software
- Python): programming language popular for manipulating and storing data, as well as for general-purpose programming
- SQL (Structured Query Language): declarative programming language used to perform tasks such as updating or retrieving data
- big data: data sets too large or complex to be dealt with by traditional data-processing software
- classification: an example of supervised learning in which an algorithm puts new data under a pre-existing category based on characteristics for which the category is already known · for example, classification can be used to determine if a customer is likely to spend over \$20 online, based similarity to other customers who have previously spent that amount
- cluster analysis: like classification, but where the algorithm receives inputted data and finds similarities in the data itself by grouping data points together that are alike, i.e. classification without supervised learning
- cross validation): method to validate the stability or accuracy of machine-learning models, often by splitting a training set in two and training an algorithm on one subset before

applying it the second

- linear regression: modeling the relationship between two variables by fitting a linear equation to the observed data, enabling prediction of an unknown variable based on its related, known variable
- causal inference: process that tests whether there is a relationship between cause and effect, often requiring subject matter expertise in addition to good data and algorithms
- hypothesis testing: use of statistics to determine the probability that a given hypothesis is true; often used in science
- statistical power): the probability of making the correct decision to reject the null hypothesis when the null hypothesis is false, i.e. higher statistical power reflects lower likelihood of concluding incorrectly that a variable has no effect
- standard error: the measure of the statistical accuracy of an estimate, such that larger sample size generally decreases standard error

| Saumya Upadhyaya (@supadhyaya) | William Galindez Arias |

NOTE: If you are looking for messaging guidelines regarding The DevOps Platform, please visit The DevOps Platform Message House.

How to use this value play

This value play will provide an overview of the DevOps Platform solution and the pain points it addresses, outline key questions you can ask to assess the customer's needs and identify relevant aspects of the solution, and offer paths to other discussions of GitLab's value.

Background

The DevOps Platform is more than just a collection of features and capabilities necessary to deliver software. It is a consciously-designed holistic solution, built to provide everything an organization needs to manage the ongoing DevOps lifecycle.

<iframe width="100%" height="500" src="https://www.youtube.com/embed/-CDU6NFw7U" frameborder="0" allow="accelerometer; autoplay; encrypted-media; gyroscope; picture-in-picture" allowfullscreen></iframe>

Desired business outcomes

- Increase operational efficiencies by reducing the overhead, maintenance, and context switching of a DIY toolchain.
- Deploy higher-quality software more quickly and consistently with a single application built to encompass the entire lifecycle, from ideation to production and back.
- Reduce risk by discovering vulnerabilities early in the process and enforcing consistent compliance guardrails throughout the DevOps lifecycle.
- Provide predictable cost scaling as your organization's needs evolve.
- Provide a seamless and comprehensive single source of truth for all collaboration.

Note: DevOps Platform vs. Single Application

While a key technical differentiator of The DevOps Platform is its single-application design, the value of that distinction is that GitLab becomes a true platform on which customers can build business success.

A good example of a similar phenomenon is Salesforce. Salesforce didn't simply replace point solutions for sales and marketing automation. It created a new category of business possibilities by providing a cloud-based unified platform for extracting, transforming, and utilizing customer insights. Likewise, GitLab has created a new category of solution that not only allows businesses to remove the unprofitable work of maintaining a toolchain, but also enables them to operate more effectively and collaboratively, across an expanded range of personas and use cases, by providing insights and efficiencies that no custom-built solution can match.

Personas

User Persona

There are two primary user personas:

1. Devon - the DevOps Engineer

Devon assists multiple different teams with varied needs. A single DevOps platform provides a consistent and efficient development experience, eliminating the burden of supporting unique, team-specific implementations.

1. Delaney - the Development Team Lead

Delaney is responsible for communication and collaboration throughout the entire product lifecycle, and requires end-to-end visibility into work items and status to accurately estimate capacity, plan features, and coordinate with all parties. A single DevOps platform provides those services natively, allowing Delaney to access necessary information as needed, without dependencies.

Buyer Personas

End-to-end DevOps requirements typically involve executive involvement - VP of DevOps, VP of Engineering, VP of Innovation and above.

The two primary buyer personas are:

1. Erin - the Application Development Executive

The consistency of a DevOps platform and the productivity gains of transparency and contextual aggregation of relevant information align to her primary goal of predictable business results.

1. Kennedy - the Infrastructure Engineering Director

For Kennedy, the most important benefit of a DevOps Platform delivered as a single application is a decreased cost-to-performance ratio while enhancing security and compliance.

Both buyer personas are also secondary user personas. While their day-to-day tasks may not revolve around the DevOps lifecycle, the collaboration and broad visibility the DevOps Platform provides will offer benefit to all adjacent roles. For example, a Product Management executive may not have historically engaged with developers, but the DevOps Platform's ability to provide a value stream view of the product roadmap's execution may encourage the executive to engage more, help discover and remove blockers, and otherwise become more collaborative.

Discovery questions

The suggested discovery questions below are meant to help you uncover opportunities when speaking with prospects or customers who are not currently using GitLab or are only using GitLab as a point solution, and not experiencing the full value of an end-to-end platform.

Don't try to use them all-just those most relevant to your customer that will help you identify the value they need to see. Please contribute additional questions!

Current state: Where's the pain?

1. How far along are you in your DevOps journey? This will scope their maturity and help you understand what success looks like. If the organization is new to DevOps, The DevOps Platform

can be a guide toward DevOps best practices that helps them avoid common pitfalls as they mature. If the company is well along their journey already, they have likely encountered very specific challenges that the benefits of a single, end-to-end platform can help them overcome.

2. What / how many DevOps tools are you using today? Similarly, this will help scope the situation. A large number of tools will almost always equal integration complexity and sub-optimal communication among tools and teams. A very small number of tools could indicate a lack of automation or an acceptance that there are just some things they cannot do (see below).

3. How do you involve business stakeholders in your DevOps process? This will reveal the coordination and alignment of technology / development with business. In many cases, it will be nonexistent or strained, and the single source of truth of The DevOps Platform can help.

4. How important are audits and compliance? Audits are a well-understood risk with a well-documented cost, and they are one of the easiest problems for The DevOps Platform to address. The presence of a strong audit/compliance culture can often indicate a desire for business stakeholders to gain visibility into DevOps / software production practices something a DevOps Platform can enable.

5. Can you predict your tool costs 2-3 years out? Since GitLab provides an end-to-end solution, it offers extremely predictable cost scaling, regardless of additional features activated, and its variety of deployment options provides additional future-proofing, even if infrastructure needs change.

Future state: Where would you like to be?

1. In an ideal world, what would collaboration look like in your organization? In addition to spelling out success criteria, this can help identify companies who may not be thinking big enough because they aren't aware that a better option exists.

2. Are there things you'd like to do with DevOps but complexity is holding you back? This is a more explicit version of the question above, generally suitable for companies that are further along their DevOps journeys.

3. What if your security teams, business stakeholders, and others had access to all the information they needed on-demand? This paints a very clear picture of both the benefits of collaboration and the extent to which a DevOps Platform can broaden engagement beyond developers and operations. It can reveal a desire to get more people included in the conversation.

4. What if you could track all your discussions, the code changes that resulted from them, the performance and security impact of those changes, and all the collaboration around them--in one place, automatically? This is similar to the question above, but more appropriate for a compliance-minded or frequently audited organization.

5. What would you do if you could reclaim the time you spend integrating and maintaining your DevOps toolchain? This provides the customer an opportunity to discuss what true success would look like if given the opportunity to rise above task work. This is the kind of transformational success a DevOps Platform can enable by freeing resources to work on more business-productive value.

Potential Objections

I don't need "all that" -- I have very specific / limited needs

This objection is most common with organizations just starting their DevOps journey. They have a specialized need (frequently, Continuous Integration, as that is the most common starting point after Source Code Management), and the market is full of specialized tools speaking to

their current challenge.

The desire to avoid "boiling the ocean" is natural. The solution is to educate the organization about what DevOps can be, when embraced fully. Take a step back and ask what the organization would like to change about software development and delivery on a business level. Do they want to be more responsive to market shifts? Do they want to increase product quality? Do they want to remain compliant while increasing velocity? With those business goals in mind, work them through the value of an end-to-end, fully automated solution, then examine the individual steps (for example, adding security scans to CI jobs, or aggregating and normalizing log data from multiple tools for audit reporting) it would take to get there.

Once the organization understands the end goal it wants to achieve and the complexity necessary to fully realize that goal, the benefits of a platform become obvious. GitLab provides an end-to-end solution in a single application, allowing customers to activate new functionality as they are ready to broaden their DevOps footprint--without having to cobble together tool after tool.

I don't want to rip-and-replace my existing tools

As an all-in-one solution, it's easy to see how someone might assume GitLab requires customers to go "all in." While any customers do just that, most others adopt GitLab gradually. Many spin up new projects and teams on GitLab, while leaving others as is until they reach the end of their lifecycle. Others may migrate a portion of their existing projects to GitLab (for example, SCM and CI), while leaving other aspects of their projects to existing tools (for example, they might leave issues in Jira or continue to use a different security scanner).

GitLab fully supports coexistence with other tools. Since the DevOps Platform provides an end-to-end solution out of the box and our unified data store provides increasing value and visibility with broader usage, most customers eventually see the benefit of moving to a full-GitLab implementation eventually, but there is no need to adopt the entire platform if not desired.

You can't be best at everything / I don't want to compromise

By GitLab's own admission, some aspects of the DevOps Platform are more mature than others. Customers naturally want the best of everything, so the possibility of "missing out" is very much on their minds when considering solutions. In these cases, work with the customer to lay out their business needs and the tradeoffs they're making to integrate a given point solution.

For example, if the customer is focused on a specific project planning solution, find out whether there are any specific must-have features that GitLab simply lacks. If that is truly the case, integrating that specific tool with the remainder of GitLab may be the best course of action as our functionality matures. On the other hand, if a solution is considered more mature for reasons that are irrelevant to the user or there is a different approach within GitLab that can meet the same business needs, the network effect of a DevOps Platform and the simplicity of maintaining it are more than enough reason to switch. In either case, the GitLab DevOps Platform can streamline and simplify the remainder of the customer's lifecycle.

We've built a system that's optimized for our business

More often than not, this objection reflects a desire to "not lose all the work we've put in" more than it does any unique business needs. With a DevOps Platform, businesses can focus their resources on differentiation that matters to the bottom line--the products and services organizations deliver to their customers. Work with customers to identify the costs (including staffing and opportunity costs) of building and maintaining their own toolchain (assets like the Forrester Total Economic Impact report can help start the conversation), then help them understand the customer value they could be generating if those resources were focused toward business goals instead of infrastructure.

I don't want to retrain

All change requires some amount of learning, but it's important to remember that training is never a "one and done," but an ongoing effort. All tools evolve, and a multi-tool toolchain with custom integrations will require ongoing training for each link in that chain. In contrast, the GitLab DevOps Platform has a single user interface, with a single, unified data store, and a single permissions model. Ramp time for GitLab is dramatically shorter than it would be for a bespoke toolchain, and ongoing training is also far simpler and faster. A common user experience also facilitates cross-functional collaboration and even career mobility within an organization.

Relevant Market Segments

The DevOps Platform is relevant to all market segments and industries, though different aspects of the DevOps Platform will resonate with each group. The [Message House](/handbook/marketing/brand-and-product-marketing/product-and-solution-marketing/usecase-gtm/devops-platform/message-house/) provides detailed information on segment messaging and positioning.

Common pain points

Operational efficiency

One common set of pain points solved by the DevOps Platform involves the inefficiency of DIY DevOps implementations. Custom toolchains are inefficient, diminishing the potential of workers who interact with it. This typically manifests in two ways.

- Productivity lost to toolchain creation and maintenance: By definition, DIY DevOps requires organizations to create and maintain a toolchain that often depends on a mix of APIs, third-party plugins, and custom code. None of the work necessary to build and maintain that toolchain produces measurable end-user value. Many organizations have tasked entire teams with toolchain maintenance, sapping resources from revenue-generating activities and, in many cases, decreasing employee satisfaction by assigning less-visible, less-rewarding tasks to development and operations staff.
- Productivity lost to context switching: Even in a fully-integrated toolchain, moving from one set of tools to another creates a measurable dip in productivity, compounded by each additional tool in a toolchain. Industry experts such as Forrester have noted the benefits of platforms in reducing this cost (please contact Analyst Relations for more information on this or other reports).
- Productivity lost to hard limitations: In many cases, DevOps toolchains are created by chaining together disparate tools that were never designed to work in concert, or in the ways modern organizations demand. In some cases, APIs may simply not offer access to necessary

data, or organizations may need to embed sub-optimal workarounds into their toolchain to assemble necessary information.

Business agility and innovation

The greater cost of operational inefficiencies is business agility.

- Visibility and metrics: If an organization cannot understand and optimize the flow of work through the Software Delivery Lifecycle, it lacks sufficient data to inform business decisions involving the creation and delivery of software products. The SDLC becomes a black box and a fulfillment blocker, rather than an agent of transformation and an input to planning for business success.
- Poor responsiveness: When a business must turn on a dime to capitalize on an opportunity or respond to a competitive threat, a cumbersome toolchain or lack of automation can bog down implementation of that pivot to the point where it arrives too late.

Key differentiators

Differentiator	Value	Proof Point
A Complete DevOps Platform delivered as a single Application	A single application eliminates complex integrations, data chokepoints, and toolchain maintenance, resulting in greater productivity.	DevOps Platform with GitLab
End-to-End Visibility	GitLab's common data model enables end-to-end visibility and traceability throughout the DevOps lifecycle, correlating and aggregating data automatically.	Deliver More Value and Fewer Headaches with an End-to-End DevOps Platform
Your software, deployed your way	GitLab is infrastructure agnostic (supporting GCP, AWS, Azure, OpenShift, VMWare, On Prem, Bare Metal, and more), offering a consistent workflow experience - irrespective of the environment.	Install GitLab: Supported Platforms

Required capabilities

The DevOps Platform is more than a collection of features and capabilities—it provides synergistic business benefits by combining those functions seamlessly and transparently. Still, the toolchain it replaces is comprised of necessary features that will be required by expected by customers.

Market Requirement	Description	Typical capability-enabling features	Value/ROI
1. Agile Planning	The solution supports the planning, initiating, monitoring, controlling, closing, and measuring the value created by Agile teams and projects.	Requirements, Epics, Features, Stories, Iterations, Backlogs, Roadmaps, Boards	Allows businesses to budget for, prioritize, deliver, and assess the success of innovation initiatives.
2. Source Code Management (Version Control & Collaboration)	Control and manage different versions of the application assets from code to configuration and from design to deployment.	Single sign-on, code ownership, change reviews and approvals, IP allowlist/denylist, activity stream, signed commits, branching and protected branches, diffing, merging, object storage, committer access rules, WebIDE, Geo and Geo HA, disaster recovery, project and file templates, design management, workflow automation, wiki, snippets, and see full list	Share and reuse code, prevent rework, and make reviews more efficient. Streamline reviews and collaboration

around code changes. Ease compliance with approvals of code changes. |

| 3. Continuous Integration | Automate and streamline build and test to improve quality and velocity. | Build automation, test automation, pipeline configuration management, visibility & collaboration, multi-platform and language support, pipeline security, and more (see full list) | CI makes software development easier, faster and less risky for development teams. |

| 4. Security | Shift security left and make it relevant throughout the delivery lifecycle. | AST, DAST, IAST, license compliance, fuzz testing, load testing, real-time reporting | Test early to eliminate vulnerabilities at the source and reduce time and cost of remediation. |

| 5. Continuous Delivery | Streamline and automate delivering and deploying code to different environments. | Progressive Delivery, Roll out scenarios, Feature Flags, Review Apps, Post Deployment Monitoring | Consistent and repeatable release processes, faster time to market and lower risk releases |

| 6. Governance, Risk Management, and Compliance | Define, enforce and report on compliance policies and frameworks | Requirements Management, Policy Management, Audit Management | Reduce risk exposure, educate developers about compliance in real-time, provide evidence of compliance to third parties. |

| 7. Incident Management | Organize multiple inputs into actionable workflows to allow the appropriate people to remedy anomalous conditions. | Manage on-call schedules, receive notifications for triggered alerts. Triage alerts and incidents. Inform stakeholders of status. | Increase customer satisfaction and application uptime by ensuring the simplest path to resolution. |

| 8. Extensibility | Extend the system to work with business applications, external data sources, and legacy point solutions. | Webhooks, APIs | Customize DevOps platform to any workflow or business need, adopt end-to-end DevOps incrementally |

Key value per tier

Premium

Generally, the more of the GitLab application in use, the greater the value of the Platform story, because there are more people in more roles contributing and accessing more data in one place. In addition to the benefits listed on the Why Premium page, there are a number of standout benefits in Premium vs. Free.

- Substantially greater visibility Advanced Search, Roadmaps, Contribution Analytics, burnup and burndown charts, and other visualizations make it far easier to achieve end-to-end visibility for a variety of needs.
- Broader persona support Features such as Epics, scoped labels, issue weights, and multiple issue assignees make Premium much more attractive as an enterprise-ready planning system, which, in turn, activates new personas such as Product Owners and Program Managers. Likewise, Auditor users and Audit Events extend the system to auditors.

Ultimate

Ultimate supports the broadest possible range of personas, extending to Portfolio Managers with multi-level epics, and first-class support for Security and Compliance personas with role-specific dashboards and a host of other features. Ultimate offers free Guest User accounts, which can invite other stakeholders to participate in discussions at no cost.

- "Best Code Collaboration Platform For Software Engineering Teams" Sujay K., G2
- "GitLab : A professional collaboration tool" Alay S., G2

Analyst Research

In their Market Guide for DevOps Value Stream Delivery Platforms, Gartner's Strategic Planning Assumption was:

"By 2024, 60% of organizations will have switched from multiple point solutions to value stream delivery platforms to streamline application delivery, up from 20% in 2021."

_{Market Guide for Value Stream Delivery Platforms, Manjunath Bhat, Thomas Murphy, Daniel Betts, Chris Saunderson, Hassan Ennaciri, Joachim Herschmann, 18 October 2021}

_{Gartner does not endorse any vendor, product or service depicted in its research publications, and does not advise technology users to select only those vendors with the highest ratings or other designation. Gartner research publications consist of the opinions of Gartner's research organization and should not be construed as statements of fact. Gartner disclaims all warranties, expressed or implied, with respect to this research, including any warranties of merchantability or fitness for a particular purpose.}

GitLab believes this indicates that the market for a DevOps platform delivered as a single application will grow much faster than the DevOps market as a whole.

Case Studies

- BI Worldwide removed technology barriers to focus on building microservices.

> One tool for SCM+CI/CD was a big initial win. Now wrapping security scans into that tool as well has already increased our visibility into security vulnerabilities. The integrated Docker registry has also been very helpful for us. Issue/Product management features let everyone operate in the same space regardless of role.

>

> Adam Dehnel, Product Architect, BI Worldwide

- Glympse consolidated ~20 tools consolidated into GitLab and remediated security issues faster than any other company in their Security Auditor's experience

>Development can move much faster when engineers can stay on one page and click buttons to release auditable changes to production and have easy rollbacks; everything is much more streamlined. Within one sprint, just 2 weeks, Glympse was able to implement security jobs across all of their repositories using GitLab's CI templates and their pre-existing Docker-based deployment scripts.

>

>Zaq Wiedmann, Lead Software Engineer, Glympse

- Goldman Sachs improves from bi-monthly builds to over a thousand per day

> GitLab has allowed us to dramatically increase the velocity of development in our Engineering Division. We believe GitLab's dedication to helping enterprises rapidly and effectively bring software to market will help other companies achieve the same sort of efficiencies we have seen inside Goldman Sachs. We now see some teams running and merging 1000+ CI feature branch builds a day!

>

> Andrew Knight, Managing Director, Goldman Sachs

Competitive comparisons

Amongst the many competitors in the DevOps space, few provide the scope to call themselves a platform, and none have been architected from the ground up as a single application.

When viewed through the lens of "the most comprehensive suite of end-to-end functionality provided in a single solution," the nearest competitor is Microsoft's Azure DevOps]. Microsoft continues to build toward the same vision with [GitHub, as well.

Industry Analyst Relations (IAR) plan

- The IAR Handbook page has been updated to reflect our plans for incorporating Use Cases into our analyst conversations.

- For details specific to each use case, and in respect of our contractual confidentiality agreements with Industry Analyst firms, our engagement plans are available to GitLab team members in the following protected document: IAR Use Case Profile and Engagement Plan.

For a list of analysts with a current understanding of GitLab's capabilities for this use case, please reach out to Analyst Relations via Slack (analyst-relations) or by submitting an issue and selecting the "AR-Analyst-Validation" template.

Professional Service Offers

GitLab offers a variety of pre-packaged and custom services for our customers and partners. The following are service offers specific to this solution. For additional services, see the full service catalog.

- DevOps Fundamentals Training (all stages of the DevOps lifecycle)
- GitLab CI/CD Training
- Integration Services
