```

SECTION: marketing/developer-relations/cocreate/_index.md

Goal

The Co-Create Program is designed to provide our customers with the necessary support and resources to drive innovation together. This could involve developing new features, enhancing existing ones, or fixing bugs.

Offer

To ensure effective use of this collaborative period, GitLab will co-locate 1 engineer for 1 week to kick off the co-development efforts. Before the onsite engagement, Developer Relations will conduct an interactive workshop to identify collaboration opportunities, ensure their engineers are adequately enabled to contribute to GitLab, and ensure all required legal requirements are met between our customer, and GitLab.

Customer Benefits

- Develop a deeper understanding of GitLab's platform beyond its use, understanding how to develop new features, product enhancements, or custom integrations on GitLab.
- Deeper relationship with GitLab product engineers and insights into GitLab's codebase and GitLab's own development and contributions processes.
- Dedicated support for contributions made by their organizations through the Contributor Success team.

GitLab Benefits

- Increased trust and ownership from participating customers
- Improved customer empathy for the participating engineer.
- Continuous contributions to fuel our dual fly-wheel approach

Getting Started

GitLab has a list of smaller issues ready to work on. Identifying and resolving a common problem together while learning the process is the quickest way to get started.

Identify areas that are of high priority to the customer together with the Solutions Architect & Contributor Success. Alignment with Product & Engineering is a required prerequisite.

1. Identify the opportunity and create a Slack channel with the following pattern cocreate-initiative-CUSTOMERNAME.

1. Determine the level of willingness and ability of the customer to contribute to GitLab.

1. Invite the CSM, SA, AE, Nick Veenhof & Raimund Hook.

1. Share your understanding of what we could work on with the customer. Contributor Success will qualify that the opportunity meets the requirements of the co-create program.

1. Contributor Success will lead the triage process and partner with the appropriate PMs. We will invite the PMs and other stakeholders of the problem-space to get their buy-in. This will result in 3 pathways:

1. The opportunity is not aligned with our roadmap or product strategy.

1. The opportunity is considered a 'minor' contribution and can entirely be handled by contributor success like any other community contribution.

1. The co-create opportunity is considered a major/relevant contribution, aligned with our roadmap and product strategy.

1. CSM and Contributor Success present the co-create program and identified pathway & align with the customer. Don't make any commitments to the customer until engineering & contributor success has aligned and allocated.

1. Involve Contributor Success (Raimund Hook) to schedule an onboarding session with the customer's engineers.

1. Only in case of a major/relevant contribution: as outlined above, we will proceed with going on-site. Invite Shekhar Patnaik into the channel & collaborate with engineering to find the right engineer we can send on-site to co-create together.

1. Only in case of a major/relevant contribution: Have the on-site with the GitLab engineer & the customer's engineer(s) to work on the identified problem together.

Roles & Responsibilities

1. Opportunity Identification: Solution Architects (SAs) and Customer Success Managers (CSMs) will collaborate with their technical counterparts within the customer's organization to introduce the program and identify opportunities for collaboration. They will also work with internal stakeholders such as Product managers.

1. Enablement: Upon identifying a viable opportunity and the right stakeholders, Developer Relations will conduct an interactive workshop to identify specific co-create opportunities and enable technically the customer's engineers to contribute to GitLab.

1. Collaborative Development: GitLab's engineering team will take the lead in pairing engineers with the customer's team to support the development effort.

Nominate an Issue for Co-Create

Is there an issue that should be considered for the curated Co-Create issue list? Reach out to the appropriate PM and ask for their approval to add the ~co-create label to the issue.

SECTION: marketing/developer-relations/cocreate/license-compatibility-guide.md

Understanding Contribution License Agreements at a Glance

Type of Contribution	Who's Contributing	Governing Agreement
-----	-----	-----
MIT-licensed code	Individual	DCO (Developer Certificate of Origin)
MIT-licensed code	Corporation	DCO (Developer Certificate of Origin)
EE-directory code	Individual	Individual CLA
EE-directory code	Corporation	Corporate CLA

Licensing Approach for Co-Create

Key Points to Understand:

- No pre-approval process is required before teams can start contributing during Co-Create

engagements

- Contributors automatically accept the governing agreement (DCO or CLA) through submission of a contribution
- The code location determines which agreement applies (MIT-licensed = DCO, EE-directory = CLA)

For Corporations who require an overarching CLA:

- Some organizations may wish to execute an overarching Corporate CLA that governs all contributions made on behalf of the corporation in order to manage who is authorized to contribute on behalf of the corporation.
- In these cases, GitLab offers an optional overarching Corporate CLA

Managing Corporate Contributions

For organizations participating in Co-Create, there are two paths:

1. Standard Contribution Path:

- Employees can immediately begin contribute to GitLab code
- By contributing, they automatically accept the governing license agreement
- No pre-approval or formal setup required

2. Formal CLA Management (Optional):

- For organizations requiring explicit contributor management
- Contact clamanagers@gitlab.com to initiate the formal Corporate CLA process
- GitLab creates a dedicated group at [gitlab.com/gitlab-corporate-cla/\[your-company\]](https://gitlab.com/gitlab-corporate-cla/[your-company])
- Your organization designates administrators to manage authorized contributors

Average timeline: 2-3 weeks from initial contact to full approval

Frequently Asked Questions

For answers to common questions about contributions, ownership, and licensing, please see Frequently Asked Questions on the DCO & CLA page.

Getting Started

To expedite the legal process:

1. Share this page and the GitLab DCO & CLA with your legal team
2. Contact clamanagers@gitlab.com to initiate the Corporate CLA process
3. Prepare a list of authorized contributions, including each contributor's GitLab usernames.

Contact Information

For legal questions: clamanagers@gitlab.com

For Co-Create program questions: contributors@gitlab.com

SECTION: marketing/developer-relations/cocreate/on-site-engineer-guide.md

Overview

The Co-Create Program enables our customers to collaborate directly with GitLab engineers to contribute features, fixes, and enhancements to the platform. This is a GitLab-sponsored program, not a paid consulting service. As an on-site engineer, you'll spend one week working closely with customer engineers to kick off their contribution journey and establish long-term collaboration patterns.

This guide provides practical advice for making your on-site engagement successful, based on experiences from previous Co-Create engineers.

Pre-On-Site Preparation

Technical Preparation

- Review the contribution scope: Understand the specific issues or features you'll be working on
- Familiarize yourself with customer context: Review their GitLab usage, technical stack, and business objectives. Request access to customer project repositories if available
- Prepare your development environment: Ensure you can quickly set up GDK and demonstrate GitLab's development workflow. Be familiar with GDK alternatives (GDK in a Box, cloud VMs) for restricted environments
- Do a technical spike: Depending on the issue complexity, do a small spike yourself and prepare an implementation plan to provide focused direction
- Identify potential blockers: Consider security, architectural, or environment restrictions that might arise
- Understand customer team backgrounds: Learn which programming languages they're comfortable with (Ruby/Rails vs Go vs Java, etc.) to tailor your approach

Communication Preparation

- Join the onboarding session: Participate in the pre-on-site customer onboarding to introduce yourself and understand the team
- Establish practical communication: Set up a communication channel that works for the customer team (WhatsApp group, Signal, phone numbers, etc.) for day-of coordination like building access, directions, or schedule changes
- Share travel itinerary: Exchange contact information and travel details in advance to ensure smooth arrivals and coordination
- Verify setup requirements early: Confirm customer teams have adequate time for GDK setup (can take 1-2 days). Set clear deadlines for environment preparation before the on-site
- Create community forks: Ensure necessary community forks are created upfront for contributions
- Align on expectations: Confirm the week's agenda, goals, and success criteria
- Understand team dynamics: Learn about the customer engineers' experience levels, roles, and motivation levels

On-Site Best Practices

Day 1: Foundation Setting

- Start with relationship building: Take time for introductions and understanding motivations
- Establish clear objectives: Collaboratively define what success looks like for the week
- Confirm environment setup: Verify all customer engineers have working GDK installations (expect this to take significant time if not done in advance)
- Provide architectural overview: Give a deep-dive into GitLab's architecture and the specific feature area you'll be working on
- Review GitLab's contribution process: Walk through the merge request workflow, code review standards, and community guidelines
- Verify contributor profiles: Remind customer contributors to sync their Organization fields in their GitLab profiles for proper attribution

Technical Collaboration

- Practice pair programming: Work side-by-side rather than directing from afar
- Explain the "why" not just the "how": Help customers understand GitLab's architectural decisions and patterns
- Provide Ruby/Rails crash course if needed: Be prepared to give a basic overview of GitLab's codebase structure, where controllers are located, etc.
- Encourage experimentation: Remind customers they can't break anything in GDK - experimentation is encouraged
- Ensure consistent environments: Try to have all customer engineers using the same GDK setup (all local, all VM, etc.) to avoid different issues
- Prioritize engaged participants: Assign critical path work to more motivated team members to avoid blocking others
- Document learnings: Capture setup instructions, gotchas, and solutions for future reference

Communication and Facilitation

- Be patient with different skill levels: Not all customer engineers will have the same Ruby/Go experience
- Encourage questions: Create a safe environment for customers to ask about anything they don't understand
- Adapt your teaching style: Some learn best by doing, others by explanation - be flexible
- Regular check-ins: Ensure everyone feels included and that progress is on track
- Plan for future contributions: Schedule a discussion about continued contribution plans on the second-to-last day of the on-site
- Build personal connections: Consider opportunities for informal interaction outside of work hours, such as team dinners or local activities, which can strengthen relationships and collaboration (these can be expensed - check with the Contributor Success team)

Managing Common Challenges

Technical Challenges

- GDK setup issues: Have troubleshooting strategies ready for common environment problems. Be familiar with GDK in a Box for Windows environments and cloud VM alternatives for restricted setups
- Restricted customer environments: Government and enterprise customers often have locked-down machines, restricted internet access, and specific security requirements
- Code complexity: Break down complex changes into smaller, manageable pieces

- Performance concerns: Help customers understand when to optimize vs. when to prioritize functionality
- Testing requirements: Guide customers through writing appropriate tests for their contributions

Process Challenges

- Code review feedback: Help customers understand that feedback is about improving code quality, not personal criticism. Be aware that GitLab's review process can feel overly rigorous and demoralizing to newcomers
- Review timing conflicts: The synchronous nature of Co-Create conflicts with asynchronous reviews. Coordinate with maintainers to ensure responsive reviews during the on-site week
- Scale considerations: For customers familiar with databases, explain how GitLab.com's scale affects implementation decisions. Show them tools like postgres.ai for query plan analysis to illustrate why seemingly simple fixes may need more consideration
- Contribution guidelines: Ensure customers understand sign-off requirements and community standards (note: licensing is handled by the Co-Create PM)
- Timeline expectations: Manage expectations about review cycles and merge timelines. Consider having a maintainer available in the same timezone

Communication Challenges

- Different working styles: Adapt to customer team preferences and communication patterns
- Variable engagement levels: Participants can range from passive observers to highly motivated contributors - adapt your approach accordingly
- Technical language barriers: Explain GitLab-specific terminology and concepts clearly
- Government/enterprise restrictions: Some customers can't use Discord, external chat tools, or screen sharing - have alternatives ready
- Physical logistics: Government sites may require escorts, have restricted lunch options, or limited meeting spaces - plan accordingly
- Remote vs. in-person dynamics: If some team members are remote, ensure they're fully included

Building Long-Term Success

Knowledge Transfer

- Document everything: Create clear documentation of setup procedures, contribution workflows, and contact information
- Identify champions: Help customer teams identify who will drive future contributions
- Establish ongoing support channels: Set up communication paths with GitLab team members for continued collaboration after the on-site
- Plan follow-up support: Ensure customers know how to get help after you leave
 - Commit to 2 hours/week for 2 weeks post-visit for MR reviews and questions
 - Account for a 30-minute check-in call in your schedule 1 week after the on-site
 - Provide your GitLab handle for async questions in MR threads

Community Integration

- Introduce community resources: Show customers how to use Discord, GitLab Forum, and documentation

- Connect with relevant team members: Introduce customers to product managers, engineers, and other contributors in their area of interest
- Celebrate contributions: Acknowledge their work publicly when appropriate

Success Metrics and Follow-Up

Measuring Engagement Success

- Technical progress: Code written, merge requests opened, tests passing
- Learning outcomes: Customer team's increased confidence with GitLab development
- Relationship building: Strength of ongoing communication and collaboration
- Future commitment: Customer team's plans for continued contribution

Post-On-Site Activities

- Retrospective session: Conduct a brief retrospective with the customer team
- Internal debrief: Share learnings with the Co-Create team for program improvement
- Ongoing support: Provide limited follow-up support as customers complete their first contributions
- Documentation updates: Update this guide based on new learnings and experiences

Key Principles to Remember

Focus on Empowerment

- Your goal is to enable customer teams to contribute independently, not to do the work for them
- Teach problem-solving approaches, not just solutions
- Help customers understand GitLab's development culture and values

Embrace the Learning Process

- Both sides should expect to learn from each other
- Customer domain expertise can provide valuable insights for GitLab's development
- Be open to feedback about GitLab's processes and tools

Maintain Quality Standards

- Help customers understand that high code quality benefits everyone in the community
- Explain the reasoning behind GitLab's development standards
- Balance learning opportunities with maintaining our codebase quality

Resources and Contacts

During Your On-Site

- Co-Create Project Manager: Available for process questions, scheduling, and escalations
- Product Managers: For feature alignment and roadmap questions
- Engineering Managers: For technical architecture and code review guidance
- Contributor Success Team: For community and ongoing support questions

For Customers

- Contributor Platform
- Contributor Documentation
- GitLab Development Kit
- Community Discord
- Co-Create Issues

Tips from Experienced On-Site Engineers

> "The best person to solve an issue is the one experiencing it. Focus on enabling them to be successful rather than solving everything yourself."

Raimund Hook

> "Your job can get converted to babysitting MRs, babysitting the people, etc. Don't get frustrated. Just make sure you talk to them as much as you can about GitLab, how they are using it, what challenges they face."

Vishal Tak

> "We should definitely share itineraries and contact info in advance to ensure smoother arrivals and better planning"

Siddharth Dungarwal

> "The reviews were expedited, which definitely made an impact on the team on-site, motivating them to contribute more."

Pedro Pombeiro

SECTION: marketing/developer-relations/cocreate/plan-fy26q1.md

Overview

This action plan outlines our strategy to launch 7 new Co-Create projects in FY26Q1. The plan establishes processes for identifying high-potential customers, engaging effectively, and ensuring successful project delivery. Our ultimate goal is to foster continuous contributions that fuel our dual fly-wheel approach, transforming initial projects into long-term contribution relationships.

Customer Segmentation Process

Customer segmentation helps us identify organizations most likely to successfully participate in Co-Create. By analyzing multiple criteria, we can focus our resources on customers with the highest probability of contributing meaningful features to GitLab.

Prioritization criteria for customer selection

- Number of public issues and merge requests created
- Usage of specific GitLab features
- Current subscription tier and seat count
- Industry sector focus (Finance, Manufacturing, Telco)
- Previous open source contribution experience
- GitLab usage growth trends
- Customer relationship strength

Data Collection

- Review Co-Create tracking data
- Document data sources
- Validate selection criteria with team
- Identify data gaps

Customer Tiering

- Tier 1: High engagement potential
 - Strong issue/MR history
 - Premium/Ultimate subscription
 - Prior contribution experience
- Tier 2: Medium engagement potential
 - No previous MR history, but clear overlap between customer and GitLab tech-stack
- Tier 3: Future potential

Outreach Process

A structured outreach process ensures consistent communication and sets clear expectations with potential Co-Create participants. This process leverages our existing customer relationships while maintaining a healthy pipeline to achieve our quarterly goals.

Target Selection

- Focus on existing account team relationships
- Prioritize top 25 scored customers
- Maintain 3x target pipeline (21+ prospects)

Engagement Steps

- Initial contact through dedicated Slack channel
- CSM follow-up if needed
- Schedule alignment meeting with:
 - Customer Success Manager
 - Account Executive
 - Solutions Architect
- Document meeting outcomes and next steps

Contribution Sustainability Strategy

While Co-Create focuses on enablement with a no-strings-attached approach, our aim is to foster

long-term contributors. This quarter we want develop processes to support this, this may include:

- Track contribution patterns across Co-Create participants
- Incorporate contribution / co-create activity into regular business reviews
- Celebrate customer contributions through case studies and social media recognition

Success Metrics

Tracking key metrics helps us measure program effectiveness and identify areas for improvement. These metrics align with our goal of launching 7 new Co-Create projects while maintaining high-quality customer engagement and fostering ongoing contributions.

Track the following:

- Number of initial meetings scheduled
- Active customer conversations
- Projects initiated
- Time from contact to project start
- Post-project contribution activity (new MRs, issues, comments)
- Percentage of customers making multiple contributions
- Average time between contributions

Risk Mitigation

Identifying and addressing potential risks ensures smooth program execution and helps maintain momentum toward our quarterly goals.

Pipeline Management

- Prepare resources for common concerns:
 - Legal documentation
 - ROI calculations
 - Technical onboarding materials
- Maintain documentation of objection handling

Process Optimization

- Create reusable templates for:
 - Communication templates
 - Meeting documentation
 - Onboarding materials
- Document clear processes for team reference

Resource Management

- Balance process improvements with pipeline goals
- Coordinate with team members for support
- Maintain clear documentation

Target Timeline

This action plan supports launching 7 new Co-Create projects by the end of FY26Q1 through:

- Building a pipeline of 21+ prospects
- Converting 33% to active projects
- Managing 8-10 week average project initiation time
- Establishing follow-up processes to encourage continued contributions

Resources

- Co-Create Issue List
- Corporate Contributor Agreement

<i class="" id="overview"></i> GitLab Community Apps Overview

The GitLab Community Apps is a suite of tools that enables the community and other teams at GitLab measure the impact of activities, programs or campaigns they run.

- Application Homepage
- Source Code

The applications are maintained by the Developer Advocacy team and MRs are welcome!

The tools available in the suite are described below.

<i class="" id="campaign-manager"></i> Campaign Manager

Campaign Manager brings together UTM tracking, URL shortening & QR Code, allowing teams at GitLab to manage campaign links from an easy to use application. Features of the tool include:

- Creating teams & managing members of the team
- Managing a group of links as a campaign
- Managing use of UTM Tracking & setting default UTM codes at team and campaign levels
- Shortened URLs for every campaign link using the go.gitlab.com domain name
- Shortened URL mode for campaign links in cases where UTM tracking is not required
- QR Codes generated for Campaign links, which can be used on physical assets.

Learn more about the GitLab Campaign Manager with the User guide.

<i class="" id="gitlab-go"></i> GitLabGO URL Shortener

<i class="" id="overview"></i> Managing Campaigns

Overview Video

<figure class="videocontainer">
 <iframe src="https://www.youtube.com/embed/UldclhWi9Bg" frameborder="0"
allowfullscreen="true"> </iframe>
</figure>

Features Demo Video

<figure class="videocontainer">
 <iframe src="https://www.youtube.com/embed/pjDUCiQwWqk" frameborder="0"
allowfullscreen="true"> </iframe>
</figure>

Use Cases

- Organize and manage links of marketing campaigns and track impressions
- Manage UTM Tracking for campaign links
- Shortened URLs using the GoGitLab domain name (go.gitlab.com)
- QR Code generation with dynamic links for use on marketing assets and scan impressions

Setting up a new account

The Campaign manager uses the Google OAuth service for authentication and only supports GitLab accounts. New accounts are created automatically using Team member profile data from Google.

Data fetched from Google Accounts are:

- Full name
- Given Name
- Email
- Profile Photo
- User ID

To sign in, click on the "Log in" link in the top right corner of the home page and click on the Sign in with Google image to proceed to log in with Google after that.

Managing Teams

The Campaign manager is structured around teams of users, and a personal team is created for every user on the first login, which can be used for personal campaigns not shared with any team.

The Dashboard currently shows teams where the logged-in user is a member, and a link to create a new team.

Creating a new team

- Click on the "Create team" button to open the Create team form
- Enter the Team Name & a short description about the team
- If your team has a utmcontent prefix, you can supply it here, this is optional.
- If the team has a general campaign for all campaigns, specify the utmcampaign value here for the UTM Campaign field. For example, the Community team uses the community as the default value for all UTM tracking done by programs in the team. You can override this value, by setting specific campaign values.
- Enter the UTM Budget (utmbudget) for the team, this will be the default value for all campaigns, you can override this for specific campaigns.
- If you only want Admins of a team to create campaigns & manage campaign, enable the Only Admins can create Campaigns checkbox. When set, other members will be limited to creating campaign links.
- Click on Create team and you should be directed to the new team's page if successful.

Managing Teams

In the team page, you can update the team's data and change options set during creation. Other sections of the page are the list of the team's campaigns and Team members

Adding a team member

- Scroll to the Team member section of a team's page and click on the "Add Team Member" button
- A form will be displayed in a modal, containing a text box to provide an Email, enter the team member's email.
- Only team members that have signed in at least once can be added as team members.

Remove team member

In the list of team members, every line has a red delete icon to remove a team member.

Add Team admins

Team members can be elevated to Admin. Admins can manage the update the team's data, manage other team members, and create campaigns if it is limited to only admins.

Click on the "Make Admin" button next to a team member to elevate their privileges.

Campaigns

Creating a new campaign

- To create a new Campaign, Click on the "New Campaign" button in a Team's page.
- The Create New Campaign form modal will pop up, provide a title and description for the campaign & click Save.
- You will be redirected to the newly created campaign's page if successful.
- An error message will be displayed in the team's page where new campaign creation is not successful

Updating a campaign

- From a Campaign's page click on the Update button and the "Update Campaign" modal will be displayed.
- You can edit the title and description provided during creation.
- The status of the campaign can be changed from "Active", which is the default, to "Archived" when the campaign is no longer running but we still want to keep its data.
- The remaining UTM fields are optional but when set, they override defaults of same fields that are set at the team level, with the exception of UTM Content, which prepends the value set at team level. Only a prefix is set for UTM Content at team level and not the full value.
- Content, Budget & Campaign correspond with utmcontent, utmbudget & utmcampaign respectively.

Deleting a Campaign

- On a Campaign's page, scroll to the bottom of the page and you'll see the red "Delete Campaign"
- Deleting a Campaign is irreversible, but as a safe guard, you can only delete a campaign if doesn't have any campaign link.

Campaign Links

Creating a Campaign Link

- On a Campaign's page, scroll to the Campaign Links section and click on "Add Link"
- Specify a title that will make it easier to recognize this campaign link among others. Its recommended to describe the resource and the Medium/Source used, if you will be using UTM Tracking. This way you can use the same link before for different use.
- In the link field, enter the link you want to track
- The UTM Content field is optional, but you can use enter a value if you want this specific link to use a different utmcontent value from other links in the campaign. The team's UTM Content Prefix will be prepended to the value supplied here.
- You can disable UTM Tracking during redirect, by setting the UTM Tracking Status to "Disabled", this makes the campaign link a URL shortener and UTM tracking codes are not appended to the link provided when a user visits.
- UTM Medium & Source are values corresponding to utmmiduum and utmsource respectively.
- Click "Add link" and you will be directed to the newly created campaign link's page.

Updating a campaign link

- On a campaign link's page, click on "Update Link"
- The form presented is similar to "Create Campaign Link" form shared in the previous section.
- Click "Update Link" once done.

Deleting a Campaign link

- Scroll to the bottom of a Campaign link's page
- Click on the red "Delete link" button
- NB: Deleting a link also deletes impressions collected over time!!!

UTM Tracking

To learn more about UTM Tracking, visit the Marketing UTM Strategy page and for the Developer Relations, review Community Team's UTM Strategy for specific guidelines for the team.

Campaign Manager currently supports utmcampaign, utmbudget, utmcontent, utmmiduum and utmsource. If you use case requires other UTM codes not supported, please create a feature proposal issue in the Community Apps project.

I don't use UTM codes, can I use Campaign Manager?

Yes, to fully use Campaign Manager without UTM tracking, leave all UTM related fields empty at the Team, Campaign and Campaign link levels and disable UTM Tracking Status for all links. If you are part of team that uses UTM tracking but don't want to use it for a specific link, set

UTM tracking status for the specific link to Disabled.

UTM Tracking Precedence in Campaign Manager

Getting UTM code precedence right is important to make use of them and if you have complicated use case for UTM tracking. UTM Codes set a Campaign link level takes precedence over Campaign and Team level codes and codes set at the Campaign level take precedence over team level codes. Only UTM Content prefix at the team level, doesn't follow precedence, it will be prepended to UTM Content codes set at Campaign or Campaign link levels.

SECTION: marketing/developer-relations/community-programs/_index.md

About Community Programs

The Community Programs team supports communities that align with GitLab's CREDIT values by executing specific programs that help these communities grow and thrive. Our mission is to help these communities experience GitLab's vision of a world where everyone can contribute.

Members of the Community Programs team serve as liaisons to their respective communities, tracking the ways those communities prefer using GitLab and translating that knowledge into insights that help GitLab create a better product. We do this by collaborating across organizational functions whenever possible.

We work with Product and Engineering teams to ensure each communities' needs are represented on the GitLab roadmap.

We work with Marketing to regularly showcase our members' success through case studies, blog posts, presentations, videos, meetups, and webcasts.

We work with Sales to identify selling opportunities latent in our repsective communities.

In all that we do, we aim to create and sustain mutually beneficial relationships between members of our programs and GitLab.

Please see the Developer Relations Program Manager Job Family for more details about individual roles on the team.

What is a community program?

GitLab's community programs aim to put GitLab's most powerful features in the hands of communities who may not otherwise have the means to access to them.

Each program is unique in its organization and execution; however, in general, community programs offer GitLab customers benefits like:

- Complimentary subscriptions to GitLab Ultimate

- Direct lines of communication to GitLab team members

- Opportunities to partner with GitLab for presentations and events

Through these programs, we seek to raise awareness of GitLab in specific markets.

We do this by partnering with members of these communities to spotlight (via case studies, articles, webcasts, and videos) ways they're using GitLab to achieve success.

The Community Programs team is the DRI for establishing community program requirements and benefits.

As each of these programs provides free, unlimited seats of GitLab Ultimate to qualifying applicants (in addition to other benefits), the Community Programs team also oversees the entitlement process.

As part of this work, the team leads community outreach efforts, marketing activities, and other strategic engagements (which may include serving on foundation boards, building partnerships, creating enablement and marketing content, delivering public presentations and learning sessions, and sponsoring events).

We strive to be thought leaders in each respective community.

What are we working on?

For visibility into the on going work in community programs please refer to the Community Programs issue board.

SECTION: marketing/developer-relations/community-programs/community-programs-workflows/_index.md

About

This handbook page describes various workflows associated with GitLab's community programs, including GitLab for Education, GitLab for Open Source, and GitLab for Startups.

By maintaining this page, we aim to establish more transparency into our workflows so GitLab team members can integrate with them.

Automated applications workflow overview

Community Programs applications workflows have been automated since FY23Q3. The Community Programs team partners with a third party, SheerID, to assist in processing applications to community programs.

The Community Programs team processes applications to GitLab's community programs with a seven-stage workflow:

Stage	Description
0. Application	Applicant completes an application form and submits it for eligibility verification.
1. Verification	SheerID and/or Community Programs team verifies applicant's eligibility.
2. Booking	Successfully verified applicants receive an email with instructions for activating complimentary GitLab licenses. Applicants receive coupon codes and enter those codes during checkout via a program-specific checkout page in the GitLab Customers Portal.
3. Provisioning	Subscription licenses are provisioned through the web direct process on the GitLab Customers Portal.
4. Compliance	(Stage handled by Sales-Support and Billing Ops teams.)
5. Renewal	Program members receive notifications when their subscriptions are due to expire. They also receive instructions for renewing those subscriptions.
6. Support	Both new applicants and renewing members can seek support for issues they encounter during most stages of the application process.

Application

SheerID hosts applications and sends all communications (email and browser notifications) for the GitLab for Education Program.

SheerID also provides customer service specific to GitLab.

MySheerID is the customer portal for the verification system.

The portal contains details on each application form, a reporting system, and account settings.

GitLab team members requiring access to the MySheerID portal can request an account through an access request.

We review GitLab's contract with SheerID on an annual basis.

Costs are based on the total number of verifications across all programs.

The application to GitLab for Startups is a Marketo form.

Verification

The verification process differs by program.

See these handbook pages for more detail:

- GitLab for Education workflows
- GitLab for Open Source workflows
- GitLab for Startups workflows

Upon successful verification, applicants receive an email with instructions for obtaining their

licenses.

These instructions include a unique coupon code generated by the fulfillment team at GitLab (via a coupon code generator).

The DRI for the coupon code generator is the fulfillment team.

To generate new coupon codes, open an issue (example) in the customers-gitlab-com project.

Additionally, note the following:

- We store sensitive, program-specific codes internally; only Alex Karsten can access these codes.
- SheerID provides coupon codes when requested via email to productsupport@sheerid.com.
- SheerID provides codes in an individual .csv file specific to each program. The .csv file should only have one column, with no header.
- SheerID provides sufficient coupon codes for one year of verifications for each program at a time. The number of coupon codes per year is determined using the following basic formula: number of applications expected per quarter + number of expected renewals * an average re-verification factor.

Booking

Successful applicants receive an email from SheerID or Customers Portal.

This email contains a direct link to a program-specific page in the Customers Portal.

These program-specific pages are not available directly in the GitLab Customers Portal; they are only accessible via links in success emails.

See GitLab's internal handbook for links to these portals.

During the checkout process:

- Applicants must enter the unique coupon codes they receive in their verification emails
- Applicants must accept a program agreement:
 - GitLab for Education Program Agreement
 - GitLab for Open Source Agreement
 - GitLab for Startups Agreement is presented directly upon checkout

The GitLab for Startups Terms:

> If you meet the requirements of the GitLab for Startups Program, you will be eligible to receive twelve (12) months Ultimate [SaaS or Self-Managed] at no cost, without Support. Renewal of the User(s) will be at the current published List Price. Your use of the GitLab Software is subject to the GitLab Subscription Agreement. Software is provided as "Free Software".

Provisioning

Licenses are provisioned directly during process via the WebDirect flow and according to one of the following SKUs:

- [EDU Program] SaaS - Ultimate (formerly Gold) - 1 Year [EDU Program] SaaS - Ultimate - 1 Year
- [EDU Program] SaaS - Ultimate (formerly Gold) w/ Support - 1 Year [EDU Program] SaaS - Support - 1 Year [EDU Program] SaaS - Ultimate - 1 Year

- [EDU Program] Self-Managed - Ultimate - 1 Year [EDU Program] Self-Managed - Ultimate - 1 Year
- [EDU Program] Self-Managed - Ultimate w/ Support - 1 Year [EDU Program] Self-Managed - Ultimate - 1 Year [EDU Program] Self-Managed - Support - 1 Year

- [OSS Program] SaaS - Ultimate (formerly Gold) - 1 Year [OSS Program] SaaS - Ultimate - 1 Year
- [OSS Program] SaaS - Ultimate (formerly Gold) w/ Support - 1 Year [OSS Program] SaaS - Support - 1 Year [OSS Program] SaaS - Ultimate - 1 Year
- [OSS Program] SaaS - Ultimate (formerly Gold) w/ Support - 3 Year [OSS Program] SaaS - Support - 3 Year [OSS Program] SaaS - Ultimate - 1 Year
- [OSS Program] Self-Managed - Ultimate - 1 Year [OSS Program] Self-Managed - Ultimate - 1 Year
- [OSS Program] Self-Managed - Ultimate w/ Support - 1 Year [OSS Program] Self-Managed - Support - 1 Year [OSS Program] Self-Managed - Ultimate - 1 Year
- [OSS Program] Self-Managed - Ultimate w/ Support - 1 Year [OSS Program] Self-Managed - Support - 3 Year [OSS Program] Self-Managed - Ultimate - 3 Year

- [Startups Program] SaaS - Ultimate (formerly Gold) - 1 Year [Startups Program] SaaS - Ultimate - 1 Year
- [Startups Program] SaaS - Ultimate (formerly Gold) w/ Support - 1 Year [Startups Program] SaaS - Ultimate - 1 Year [Startups Program] SaaS - Support - 1 Year
- [Startups Program] Self-Managed - Ultimate - 1 Year [Startups Program] Self-Managed - Ultimate - 1 Year
- [Startups Program] Self-Managed - Ultimate w/ Support - 1 Year [Startups Program] Self-Managed - Ultimate - 1 Year [Startups Program] Self-Managed - Support - 1 Year

Compliance

Sales-Support and Billing Ops handle compliance-related issues.

This stage results in granting the license and notifying the customer of how to access the licenses.

The Community Programs team ensures compliance with Program Agreements.

In cases where the Community Programs team believes a program member's actions violate the terms of a Program Agreement, team members will report the suspected violation by opening a Legal and Compliance issue.

The Community Programs team will then collaborate with GitLab's Legal team to determine the most appropriate method of assessing the issue.

In cases where the Community Programs team believes a program member's actions violate the terms of a Program Agreement, and the violation is curable, the team will enact the following procedure to begin redress and ensure compliance.

First, the team will notify the program member of the suspected violation with a message that conforms to the appropriate template.

The purpose of this message is to:

- Serve as formal notice that under the terms of an applicable Agreement the program member's current use of the licenses granted is not in compliance with the terms of the applicable Agreement.
- Signal the beginning of the 30-day cure period, by the conclusion of which the program member must rectify the failure

- Express interest in and commitment to working with the program member to remedy the situation
- Offer to meet with (or communicate asynchronously with) the program member to answer additional questions about the member's use of GitLab under the terms of the Program Agreement

Members of the Community Programs team will then work with the program member to cure the failure before the 30-day cure period has concluded.

At the conclusion of the cure period:

If the program member remedies the situation, then no further action is necessary and the program member can continue using its GitLab subscription. The program member should expect to renew this subscription at the conclusion of its term, and at that time be subject to review of its eligibility criteria.

If the program member does not remedy the situation, then GitLab will terminate the subscription license it granted the program member under the terms of the applicable Agreement.

Certain situations may warrant immediate evocation of a program member's subscription license. In those cases, GitLab will use best efforts to notify the program member prior to revocation subject to the terms of the applicable agreement.

To revoke a subscription license, GitLab team members should engage GitLab's Sales Support team via Salesforce as follows:

1. Locate the subscription associated with the license in question
1. Chatter Deal Desk to request this subscription be "debooked"

Debooking a subscription revokes its associated Ultimate license.

Renewal

Applicants renewing their program memberships must re-apply to their respective programs to ensure continued eligibility.

To do this, they use the same application forms they used when initially enrolling in the program.

The success email will contain a direct link to a program-specific page for each program (Education/Open Source) in the GitLab Customers Portal.

The program-specific pages are not available directly in the GitLab Customers Portal without the direct link.

See Community Programs' internal handbook for direct links to these portals.

As they did when initially applying for the program, applicants enter their unique coupon codes during the checkout process.

Supporting the automated application workflow

Each step of the automated application workflow has different set of potential errors and related support workflows.

Phase	Source	Error	DRI	Action
Verification	SheerID Application	False Rejection	EDU	SheerID Contact SheerID from Rejection Email.
Verification	SheerID Application	False Rejection	OSS	Open Source Service Desk / Open Source Program team Contact opensource@gitlab.com from rejection email
Verification	SheerID Application	Never received success email	SheerID	SheerID Help Center FAQ - Form resends email
Verification	SheerID Application	Deletes success email.	SheerID	SheerID Help Center FAQ - Form resends email
Verification	SheerID Application	Form not responding or something goes wrong with form.	SheerID	Contact SheerID Support Team
Verification	SheerID Application	Applicant makes a case to SheerID that EDU rejection was in error but SheerID cannot resolve.	Education Program team	SheerID emails education@gitlab.com with details. GitLab EDU team resolves.
Booking	GitLab Customers Portal	Coupon Code has already been used	GitLab Support	Error message on the portal. The code has already been used. There is no CTA on the portal, user will go back to email which directs them to open a support ticket under Issues with billing, purchasing, subscriptions, or licenses.
Booking	GitLab Customers Portal	Coupon Code is invalid	GitLab Support	Error message on the portal. This code is not valid. Try re-entering the code from your email. There is no CTA message on the portal, the user will go back to email which directs them to open a support ticket under Issues with billing, purchasing, subscriptions, or licenses.
Fulfillment	GitLab Customers Portal	Any problems with Customers Portal itself after coupon code succeeds.	GitLab Support	Open Support Ticket Issues with billing, purchasing, subscriptions, or licenses.)
Fulfillment	GitLab Customers Portal	If the applicant enters the incorrect number of seats or chooses the incorrect hosting type (self-managed or SaaS) and the license has already been granted, the application will need to obtain an add on quote to change the license parameters	Community Programs	Email education@gitlab.com , opensource@gitlab.com , or startups@gitlab.com requesting changes

The Community Programs team is responsible for all processes involved in issuing licenses for GitLab's community programs.

The team also maintains program support queues, through which all Community Programs emails are funneled.

Below are details related to various Community Programs workflows.

Inbound sales requests routing workflows

Sales team members receiving inbound requests regarding community programs should adhere to the following workflow and direct leads according to the routing table below.

If the lead is inquiring about	Then take this action
Whether they qualify for a specific program	Send the relevant marketing or handbook page detailing the program's requirements
How to apply for program membership	Send the relevant marketing or application page with instructions and an application form

| How to renew | Send the relevant marketing or application page with renewal instructions and the application form |

| How to alter some aspect of a subscription | Ask them to email the relevant program for assistance |

| An edge case | Ask them to email the relevant program for assistance |

Common program-related Salesforce workflows

Edit an address

1. Navigate to the Account view in Salesforce. Scroll down to the Address Information, Billing Address.

- Note: The Billing Address can also be accessed from the Contact view.

1. Click the edit button to edit the address. Click OK to save the changes.

- Note: The address should update for the Account, Contact and Opportunity.

Reassign a Salesforce object

1. Click Change next to the object owner field and select the appropriate owner.

Merge duplicated accounts

1. Make sure the domain and account names are the same.

1. Chatter @Sales-Support one of the accounts and request that the accounts be merged.

View a signed quote

1. Once signed the document will be automatically attached to the Opportunity in the Google Docs, Notes, and Attachments section.

Apply naming conventions

Naming conventions

- Lead status: Accepted means Program Manager reached out to the lead/contact
- Lead status: Qualifying means Program Manager is in 2-way conversation with lead/contact
- Lead status: Unqualified means Applicant is not qualified for that program

Check approval history

1. From the Opportunity click Approval History.

1. Each step in the process will appear under Action.

1. If the opportunity was approved the Overall Status will indicated Approved.

1. If the opportunity appears to be stalled in the process, chatter the person the opportunity is assigned to.

Chatter the Sales team

Chatter is the primary method of communication between users and groups in Salesforce. Chatter can occur at Account or Opportunity level.

Chatter notifications for individuals can be found on the individual's home tab in Salesforce.

- Sales team members (operations and account owners) will chatter Program Managers or individuals when an action is required on a record.
- When an individual is chattered the message will appear both at the top of the object from which the chatter initiated, i.e. Account or Opportunity and it will appear in the Chatter tab of Salesforce.
- In order to chatter someone directly you can type @{NAME} in the chatter window and select the name of the person or group you wish to chatter.
- For most questions related to the EDU-OSS workflow, chatter @Sales-Support

Close expired renewals

The sales team might tag the Program Manager in expired opportunities that were never processed.

This could be the result of an applicant deciding they no longer need a GitLab license, or a group not reaching out to renew their license.

While it's not a priority, it's important these expired opportunities be processed in Salesforce.

1. The sales team will chatter the Program Manager on expired opportunities.
2. On the opportunity page, click Edit
3. Update the Close Date to today's date.
4. Change the Stage to 8- Closed Lost
5. Update the Closed Lost/Unqualified Detailed section to other and add details that say "Educational Institution did not reach out to renew" or "Educational Institution did not move forward with license"
6. Save the opportunity details.
7. Close the case in the Case Queue.

Editing and resending a quote due to Zipcode Error

If an error is made on a quote, for example, a missing zipcode or incorrect billing contact, you'll need to update and resend the quote via Salesforce and DocuSign.

1. Navigate to the relevant opportunity
2. Click on the 'Contacts' section and choose the contact that serves as the Sold To/Bill To contact. Update the address on the billing contact's page. Click 'Save'
3. Return to the opportunity, scroll down to the 'Quotes' section and click the link to the relevant quote in the 'Quote Name' column
4. Click 'Generate PDF Doc' and proceed with standard process for sending a quote through DocuSign.

Editing and Resending a quote due to a Sold To / Bill To Contact Error

1. Navigate to the relevant opportunity
2. Scroll down to the 'Quotes' section and click the link to the relevant quote in the 'Quote Name' column

3. Click the 'Edit Quote Details button'
4. Update the Sold To/Bill To information by searching and selecting the correct contacts.
5. After making the edits, click 'Save'
6. Click 'Generate PDF Doc' and proceed with standard process for sending a quote through DocuSign.

Overview

This page contains details regarding workflows specific to the GitLab for Education Program. GitLab uses a third party, SheerID, for verification services.

The GitLab for Education Program provides SheerID with the program requirements and the SheerID platform is able to verify if an individual meets our requirements by matching applicant-provided data against authoritative data sources automatically.

SheerID instantly confirms whether or not there is a match and either successfully verifies the applicant or rejects the applicant.

Education Service Desk

We assist Education Program members who are blocked in the process of renewing or applying, as well as those with general questions about the program.

To review any current applications, support tickets or common questions please review the Service Desk below.

- Education Service Desk

Managing application forms

SheerID hosts two separate forms for the GitLab for Education Program due to differences in the reference the data set: the University Teacher Program form and the K-12 Teacher Program form.

University Teacher Program Form

The University Teacher Program form is the form for all higher education institutions in 194 countries.

This form contains the following fields:

- First Name
- Last Name
- Email Address
- Job Title
- Country (drop down list)
- Institution Name (drop down list)

For reasons relating to trade controls, we are unable to accept applicants from Cuba, Iran,

Syria, North Korea, Russia, Belarus, or Ukraine.

K-12 Teacher Program Form

The K-12 Teacher Program form is the form for all K-12 institutions in the United States. SheerID does not currently have the reference data for K-12 in other countries, therefore this verification form is limited to the United States.

This form contains the following fields:

- First Name
- Last Name
- Email Address
- Job Title
- Institution Name (drop down list)

GitLab currently does not have the legal and operational requirements in place to offer SaaS licenses to any institution that may have children under the age of 13.

The K-12 portion of the GitLab for Education Program is therefore on hold until the requirements are in place.

Application verification workflow

The SheerID verification flow for the University Teacher Program Form and K-12 Teacher Program Form are detailed here in the SheerID Flows section of the SheerID Developer Center.

If applicants are not successful with the automated verification process, they will be prompted to upload a document that shows: full name and school name with a date in the current year. Acceptable examples include Teacher ID card with valid date and pay stub from within the last 60 days.

Manual application review

Applicants will have 3 attempts to upload a document providing verification of eligibility. SheerID will manually review these documents. Upon the third unsuccessful attempt, applicant will be rejected.

If SheerID is unable to determine the eligibility based on the document review, SheerID will forward the applicant's record to education@gitlab.com.

The GitLab for Education team will review the documentation and determine eligibility.

Verification limit

Any individual can apply through the form and verify up to 5 times per 365 days.

This limit provides room for error and allows a single individual at an institution to apply for licenses on behalf of individual sub-units within the institution.

For example, an information technology administrator may apply and hold the license for multiple colleges or departments on one campus.

This limit is determined by GitLab and set in the system by SheerID.

It can be changed at any time.

GitLab in Academic Research Citation Index

We have an MVC GitLab in Academic Research Citation Index on the GitLab for Education Home page.

EndNote web will serve as the SSoT for the GitLab in Academic Research Citation Index displayed on our webpage.

EndNote is an online tool that stores citations, allows collaboration, and has search functions.

An added benefit of EndNote web is that we can export the citations in any standard citation format.

The workflow for updating and tracking the citation index is below.

You'll need to create an EndNote account from the EndNote homepage and notify the Developer Relations team who will share the GitLab Citation Index Group with you.

Finding and adding citations to the index

1. Find relevant citations on Google Scholar.
1. Save the citations your Google Scholar Library
1. Export the citations in EndNote format.
1. Log into your EndNote account. See note below if you do not have an account. Import the citations from Google Scholar

- From the Collect menu go to Import References
- Choose the File
- For Import Option choose EndNote
- For To choose GitLab Citation Index Webpage Group

1. View each citation from the My References menu
1. Update any relevant information that may have not imported correctly
1. Add relevant keywords
1. Save the citation

Adding citations to the web page

1. Prepare a row in the citation index table on the webpage to store the new citation
1. In EndNote Web, go to Format and Bibliography
1. In References choose GitLab Citation Index Webpage
1. In Bibliographic style choose Cite Them-Right Harvard
1. In Format Style choose HTML
1. Preview and Print the index
1. Find the relevant citation
1. Copy and paste the citation into the placeholder
1. Update the Notes field in the citation record in EndNote with added to website so we are able to track which citations have been added.

SECTION: marketing/developer-relations/community-programs/community-programs-workflows/oss-

Overview

This page contains details regarding workflows specific to the GitLab for Open Source Program. Because the GitLab for Open Source Program is part of GitLab's Community Programs, team members verify applications by using the team's standard, seven-step application workflow. See the handbook page on that workflow for details that pertain to all GitLab community programs.

Program application form

GitLab Customers Portal contains the application form to request a GitLab for Open Source license.

The workflow in this form is divided into two types of submission:

An open source project is located on GitLab.com

Applicants select a namespace that contains the project and check the program agreement. After pressing the submit button, namespace verification starts to make sure that it meets basic program requirements:

Each project inside the namespace includes an OSI-approved open source license.

Namespace includes at least 1 public project.

Namespace includes at most 1 private project.

Once the check is passed, the customer receives an email with further instructions. For more information about the check for an OSI-approved license see [GitLab Docs](#).

An open source project is located on a Self-managed instance

Applicants must explain why they need a self-managed solution instead of using GitLab.com. They must also provide basic information about their project and a publicly accessible link to the namespace. Applicants receive a response within five business days.

The form also includes the following statement, added with help from the GitLab Legal team:

> I certify that the project maintainers are not seeking to make profit from this project by, for example, selling services or higher tiers. Make sure your use case qualifies.

For reasons relating to trade controls, we are unable to accept applicants from Cuba, Iran, Syria, North Korea, Russia, Belarus, or Ukraine.

Verifying applicants

Eligibility requirements for the GitLab for Open Source Program are listed in the program's handbook page.

The application form performs basic alignment checks for program applications.

Verification flow for projects located on GitLab.com (SaaS) is fully automated. However, the

team still needs to process the Verification phase for Self-managed applications manually. The Self-managed workflow requires an application processing team until further automation is implemented.

If the namespace does not qualify for the program, the team will send the applicant a rejection email that follows the team's correspondence template.

Applicants can then contact opensource@gitlab.com if they believe the rejection was sent in error, or if they have additional questions about eligibility.

Verification limit

Any individual can apply and reapply through the GitLab Customers Portal form until verification succeeds. For the Self-managed use case, an applicant can send a request once per day.

This limit provides room for error and allows a single individual to apply for licenses on behalf of multiple open source projects.

It can be changed at any time.

SECTION: marketing/developer-relations/community-programs/community-programs-workflows/startups-program-workflows.md

Overview

This page contains details regarding workflows specific to the GitLab for Startups program. Please see the Community Programs Workflows page for complete details on the program's application process.

Currently, only VC- or accelerator-backed startups are eligible for the program.

Startups are not eligible for the program if they have been paying GitLab customers within one calendar year.

We categorize their approval offering by two different funding qualifications:

- Seed Stage: Less than \$5 million USD in funding
- Early Stage: Greater than \$5 million but less than \$20 million USD

Startups must submit proof of association with a VC or accelerator fund, along with current funding status.

The easiest way to obtain this information is a Crunchbase, PitchBook, or Y Combinator profile link, which should be submitted upon application.

Startup Program Service Desk

- We use issue Boards in GitLab service Desk to manage the Startups Program applications and support.
- If you are looking to check the status or file a question with the Startups Program please do so via the Startups Program Issue Board below.
- Startups Program Issue Board

Forms

Our application is a Marketo form with the following fields:

- First Name
- Last Name
- Email Address
- Country (drop down)
- Company Name
- Billing Address
- City
- Postal Code
- Country (drop down)
- Please provide a crunchbase, pitchbook, or y-combinator profile. Alternatively,
