

we are manually uploading lead lists. This also supplies a buffer in the event the SLA is not met on schedule and the campaign runs longer than anticipated.

- Do not use asset expiration at all. We often have content syndication focused programs that go on indefinitely so expiration does not make sense to utilize in this case. Assets can be discontinued in the future.

Setting Asset Expiration On A Program

- Right click the Marketo program to open the program menu and select Set local asset expiration. Please note, this will not work without the correct permissions.
- A menu with all expiration capable assets will be shown as a segmented list. Example assets that can appear are landing pages, active trigger campaigns and Reoccurring batch campaigns.
- Use the asset checkboxes to select all assets you wish to set an expiration for and select set expiration when ready. Assets that should be expired are active trigger campaigns and Reoccurring batch campaigns. Set your date and time and then submit.
- Prioritize setting expirations on smart campaigns.
- Be mindful of which smart campaigns are set to expire and when because such an event will disable program registration flows.
- To remove expirations at a later date, right click on the program to return to the capable assets and submit changes.

Step 5: Update the Salesforce campaign

Refer to instructions above.

- Add the Marketo program link and SFDC campaign link to the epic.
- If the program is being ran by Digital Marketing, add the SFDC campaign under the parent campaign Demand Gen Publishers/Sponsorships

If utilizing Allocadia, please refer to the instructions above.

Steps to Setup Content Syndication in Marketo and SFDC - Campaigns through Integrate DAP

If your content syndication program is not running through Integrate DAP, please use the instructions above.

The SFDC campaigns for these are set-up by Region/Vendor/Asset combination. The Marketo programs are created by Region/Vendor pair. If your region/vendor already exists in Marketo, you only need to add the new asset to the tokens and automation. If you only need to add a new asset to an existing Region/Vendor pair in Marketo, skip to the instructions below.

You must keep the same Asset number for existing assets, otherwise the existing automation will fail. A complete list of the current assets is available [here](#). Be sure to add new assets to this list to maintain a SSOT for reference.

Interesting Moments for content syndication are global. This means that you only need to follow the instructions below to update the tokens at the folder level and the Vendor at the program level. IMs are automated using this data.

Instructions to add a new Region-Vendor-Asset combo

Step 1: Create SFDC campaigns

- Create the SFDC campaigns directly in Salesforce. Each asset requires a campaign.
- Format: YYYYRegionVendorAssetName (examples:
2024AMERDemandScience2023DevSecOpsReport:ProductivityEfficiency,
2024EMEAIntegrateAchieveDevSecOpswithGitLabCI/CD)
- Associate this campaign to the appropriate parent campaign.
- Refer to instructions above.

Step 2: Clone this program

Clone this program - ContentSyndRegionVendorDAP

- Use format ContentSyndRegionVendor
- Save the program to the folder: "DAP Content Syndication"
- For new EMEA programs only: Have a member of the MOps team make the following updates. You can put a note in the mktgops Slack channel and provide the new program Marketo link and a link to these instructions, OR you can add the MktgOps:: 00: Triage label to your set-up issue with this information in a comment. MOPS: Go to this program (opt-in value change). Add the Marketo program name to the Member of program exclusion list. This makes sure that the compliance fields for Germany are not overwritten by our system processes.

Step 3: Update Marketo tokens

- Tokens for the asset name and type are handled at the folder level (DAP Content Syndication). The tokens for the SFDC campaigns are handled at the program level (for example: ContentSyndAMERIntegrate).
- Be sure to reference the existing asset list when you complete the tokens. Do not include the Asset [number] - in the token value.
- To add a new asset, click on the DAP Content Syndication folder. Click "My Tokens".
- Click and drag the word Text into the token area.
- Under Token Name, name the token Assetx-Title. Marketo will add the my. and brackets. For example, if you are adding asset 18, name the token Asset18-Title.
- Under Value, enter the name of the asset without the Asset Number. This will be used to populate the Interesting Moments and the asset number isn't necessary.
- Click Save.
- Click and drag the word Text into the token area.
- Under Token Name, name the token Assetx-Type. Marketo will add the my. and brackets. For example, if you are adding asset 18, name the token Asset18-Type.
- Under Value, enter the asset type. The options are Whitepaper, eBook, Report, Video, General, or Infographic
- Click Save.
- After you add your asset name and type to the main content syndication folder, click on the program you created for this region/vendor.
- Complete the {{campaign owner email}}, {{region}}, and {{vendor}} tokens.
- In order to complete the {{my.Assetx-sfdccampaign}}, the campaigns must be created in SFDC first and the campaign in SFDC must be marked as Active. This token will validate the campaign exists in SFDC in order to populate. Pay close attention to the asset number you are populating. The tokens are not in order.
- Add the SFDC campaign for each asset you are using for this Region/Vendor pair.

Step 4: Modify & Activate Marketo smart campaigns

It is critical that any reference to asset number in Marketo automation (not tokens) uses the format Asset [number] - ("asset number space -"). For example Asset 1 - and Asset 12 -. This allows the automation to select the proper asset since we are using "contains" to trigger the automation. Without the (space) - after the asset number, both Asset 12 and Asset 1 will be recorded as Asset 1.

- If your asset qualifies for an Action Stream, click on the Check for Action Stream asset (content synd) campaign. If your asset does not qualify for an Action Stream, skip this step.
 - Smart list: Filter 1 - Add the Asset number (follow the existing format shown in the filter)
 - Flow: Add the Asset number to the relevant Choice. You will see the Action Stream listed in "New Value"
- 01 Processing
 - Smart list: No changes. Confirm that all references to the Marketo program match your program name.
 - Flow (confirm that program references match the Marketo program name):
 - Step 3 - Add to SFDC Campaign - Delete the selection for any assets you are not using for this Region/Vendor by clicking the X next to the relevant Choice. Confirm that you are deleting the choice referencing the correct asset.
 - If you add any SFDC campaigns to the list, be sure to use "Content Syndication asset CONTAINS Asset x -" in your filter.
 - Double touch campaigns - The template is set-up to accommodate double touch campaigns. There is a second Add to SFDC Campaign flow step that is based on "Content Syndication Asset 2". You do not need to remove this. However, if you will NEVER use a double touch campaign with the vendor/region, it is recommended to remove this flow step. In case you do not, it is set-up that if "Content Syndication Asset 2" is empty, the step will be skipped.
 - Step 6 - Execute Campaign (Content Syndication Asset) - (Action Streams) If any of the assets being promoted are associated with an Action Stream, add them to this Execute Campaign flow step. Several assets are already listed. This will call a separate campaign to process the lead so it is properly added to the relevant Action Stream.
 - Double touch campaigns - You will need to add a second Execute Campaign to check for Action Stream qualification for "Content Syndication Asset 2". Confirm the second execute campaign is not on your processing flow (one for Content Syndication Asset, one for Content Syndication Asset 2). If it is not, add "Execute Campaign" and Add 2 choices. Choice 1: If Content Syndication Asset 2 is empty, Do Nothing. Choice 2: If Content Syndication Asset 2 contains "list of asset x -" (you can copy this from the Content Syndication Asset execute campaign), Executed campaign: Check for Action Stream asset (content syndication). Use parent token context: false. Default Choice: Do nothing
 - Schedule: Click on Activate. This should be set to Each person can run through the flow every time.
- 03 Manual upload processing - No action is required here. This campaign is used if the DAP sync fails.
- Interesting Moments - These are global, but you must add new assets to the Flow. Click the global Interesting Moments - Content Syndication executable campaign.
 - Click Add Choice.
 - To add the new choice, change it to Content Syndication Asset contains Asset x -, Type: Milestone, Description: Downloaded {{my.Assetx-Type}}-{{my.Assetx-Title}} from 3rd party site: {{my.vendor}}. Replace the x in the token with the asset number.

- Move the new asset number to the bottom of the list (to keep the numbers in order).
- Not added to SFDC - This isn't a campaign to activate, but this report will help you track issues with leads being added to SFDC.
- Smart List: In filter 2 - Member of SFDC Campaign add the specific SFDC campaigns for this program. Click on green plus sign, then start typing. A list of SFDC campaigns will come up and you can click on them to add them to the list. Click OK.

Step 5: Important information for content syndication list uploads

This applies to a manual upload or the sync from DAP.

When you do your list upload, you must be sure that the Asset number] - that corresponds to each asset is included in the Content Syndication Asset field so the automation will trigger, using the format Asset [number] - ("asset number space -"). The recommendation is to populate the Content Syndication Asset field using the format Asset [number] - Name of asset (example: Asset 2 - 2023 Global DevSecOps Report: Security & Compliance). A complete list of current assets with their asset number can be found [\[here\]](#). This also applies if the responses are set directly from the vendor. They must be set-up in the vendor system with the appropriate asset number.

It is critical that any reference to asset number in the upload or send from the vendor uses the format Asset [number] - ("asset number space -"). For example Asset 1 - and Asset 12 -. This allows the automation to select the proper asset since we are using "contains" to trigger the automation. Without the (space) - after the asset number, both Asset 12 and Asset 1 will be recorded as Asset 1. These instructions apply to the "Content Syndication Asset 2" for double touch campaigns field as well.

Step 6: Test lead flow into your Content Syndication programs

There are a few common errors we see with Content Syndication leads. You can address most of these before sending the first test by working with the vendor to confirm they have the correct values.

- Employee Bucket (Employee count): Values here. These values must be written exactly as shown (using commas and correct spacing).
- State: We only accept State values for the United States, Canada, and Australia. The vendor must pass blank values for any other country, otherwise SFDC will reject the lead.
- Content Syndication Asset: Required field. The values for this field need to be passed exactly as outlined above in step 5. If they are not, the automation on the program will fail.
- Content Syndication Asset 2: Only required for double touch campaigns. This value should be pushed as blank otherwise. The values for this field need to be passed exactly as outlined above in step 5. If they are not, the automation on the program will fail.
- After verifying the common field mistakes above, work with the vendors to submit test leads through DAP.

1. After the test lead is submitted, go to Marketo, click on the "Database" tab, and enter the email address of the test record in the search box under "Quick Find". You can always get to this box by clicking on the "Default" folder in the left sidebar.

- If the record was found, that means the pass to Marketo worked properly and you can continue to the next step.

- If it was not found, confirm the email address and search again. If you still do not find the record in the database, confirm with the vendor that they sent the test leads and that their system is properly configured to pass records directly to Marketo.

1. Open the test record in the Marketo database. Go to the Activity History tab. If you have done this before and saved your view, select your custom view called "Content Syndication Verification". If this is the first time you are completing this process, click "Filter: None", select "Custom" and set-up a custom view as follows:

- Under Smart Campaign, select "Change Program Status", "Interesting Moment"
- Under Salesforce.com, select "Add to SFDC Campaign"
- Click "Save As" and name the view "Content Syndication verification"

1. Confirm that the program you are testing is the program that the lead was added to with a status of "Downloaded". You will see this as a "Change Program Status" and it will show "name of the program" changed from "Not in program" to "Downloaded".

- If the record was not added to a program, confirm that the 01 Processing campaign is activated in the program. If not, activate it and have another test sent through. If the campaign is active or the lead was added to the wrong program, this means the vendor pushed an incorrect ID for the program and you need to follow-up with them directly to correct it.

1. Confirm that the record was added to the correct SFDC Campaign for the asset that was tested.

- If you see an SFDC campaign name, this means the addition to SFDC was successful.
- If you see an error that looks similar to "Failed: {InvalidORNULLFORRESTRICTEDPICKLIST}" for the "Add to SFDC Campaign" activity type, this means the record did not push to SFDC. Read the error as it will tell you what was wrong. It is usually either due to a State Value or an incorrect value in Employee Bucket. Have the vendor correct this and push another test lead.

- If there was no failure but the lead either wasn't added or was added to the wrong campaign, this means that the SFDC campaign was not added to the correct token, the asset was not added to the Flow steps, or the Content Syndication Asset field value was incorrect from the vendor.

1. Confirm that the correct Interesting Moment was Triggered

- If no IM triggered, confirm that the asset was added to the Interesting Moments - Content Syndication campaign. If the asset is listed, check to make sure that you have all of the assets set-up correctly in the Flow steps. You are likely missing an asset in the flow steps or the format of the Content Syndication Asset field was incorrect from the vendor.

1. If you need to check the email deployment, change the "Filter" view to Email and confirm that the correct email was sent. In most cases, this should be the Welcome Email without a language specified.

1. Check the Not Added to SFDC Smart List to make sure your test lead doesn't show up there.

Steps to Setup Content Syndication - Campaigns through Integrate DAP - adding a new asset

If your content syndication program is not running through DAP, please use the instructions above.

The SFDC campaigns for these are set-up by Region/Vendor/Asset combination. The Marketo programs are created by Region/Vendor pair. If your region/vendor already exists in Marketo, you only need to add the new asset to the tokens and automation. These instructions are to add a new asset to an existing region/vendor program in Marketo. You can also use these instructions to add additional assets (beyond the 58 already determined) to a new Region/Vendor Marketo program.

Step 1: Add new assets to the SSOT spreadsheet

You must keep the same Asset number for existing assets, otherwise the existing automation will fail. A complete list of the current assets is available [here](#). Be sure to add new assets to this list to maintain a SSOT for reference.

Step 2: Create SFDC campaigns

- Create the SFDC campaigns directly in Salesforce. Each asset requires a campaign.
- Format: YYYYRegionVendorAssetName (examples:
2024AMERDemandScience2023DevSecOpsReport:ProductivityEfficiency,
2024EMEAIntegrateAchieveDevSecOpswithGitLabCI/CD)
- Associate this campaign to the appropriate parent campaign.
- Refer to instructions [above](#).

Step 3: Find the existing Marketo program for your Region/Vendor pair

Step 4: Add new Marketo tokens

- Tokens for the asset name and type are handled at the folder level (DAP Content Syndication). The tokens for the SFDC campaigns are handled at the program level (for example: ContentSyndAMERIntegrate).
- Be sure to reference the existing asset list when you complete the tokens. Do not include the Asset [number] - in the token value.
- To add a new asset, click on the DAP Content Syndication folder. Click "My Tokens".
- Click and drag the word Text into the token area.
- Under Token Name, name the token Assetx-Title. Marketo will add the my. and brackets. For example, if you are adding asset 18, name the token Asset18-Title.
- Under Value, enter the name of the asset without the Asset Number. This will be used to populate the Interesting Moments and the asset number isn't necessary.
- Click Save.
- Click and drag the word Text into the token area.
- Under Token Name, name the token Assetx-Type. Marketo will add the my. and brackets. For example, if you are adding asset 18, name the token Asset18-Type.
- Under Value, enter the asset type. The options are Whitepaper, eBook, Report, Video, General, or Infographic
- Click Save.
- Go to the program for the Region/Vendor you are adding an asset for (for example ContentSyndABMAMERMadison Logic). Click "My Tokens"
- Click and drag SFDC Campaign into the token area.
- Under Token Name, name the token Assetx-sfdccampaign. Marketo will add the my. and brackets. For example, if you are adding asset 18, name the token Asset18-sfdccampaign.
- Under Value, start typing the SFDC campaign you created in Step 2. It may take time for SFDC to sync to Marketo, so if it is not immediately available, use a placeholder campaign and set a reminder to come back to it after you complete the other steps.
- Click Save.

Step 5: Modify Marketo smart campaigns

It is critical that any reference to asset number in the Marketo automation below uses the

format Asset [number] - ("asset number space -"). For example Asset 1 - and Asset 12 -. This allows the automation to select the proper asset since we are using "contains" to trigger the automation. Without the (space) - after the asset number, both Asset 12 and Asset 1 will be recorded as Asset 1.

- Interesting Moments - These are global, but you must add new assets to the Flow. Click the global Interesting Moments - Content Syndication executable campaign.

- Click Add Choice.

- To add the new choice, change it to Content Syndication Asset contains Asset x -, Type: Milestone, Description: Downloaded {{my.Assetx-Type}}-{{my.Assetx-Title}} from 3rd party site: {{my.vendor}}. Replace the x in the token with the asset number.

- Move the new asset number to the bottom of the list (to keep the numbers in order).

- 01 Processing

- Flow:

- Step 3 - Add to SFDC Campaign - Click Add Choice. To add the new choice, change it to Content Syndication Asset contains Asset x -, Campaign: {{my.Assetx-sfdccampaign}}. Replace the x in the token with the asset number. This is the token you added in Step 4. Status: Downloaded.

- Double touch campaigns - The template is set-up to accomodate double touch campaigns. There is a second Add to SFDC Campaign flow step that is based on "Content Syndication Asset 2". You do not need to remove this. However, if you will NEVER use a double touch campaign with the vendor/region, it is recommended to remove this flow step. In case you do not, it is set-up that if "Content Syndication Asset 2" is empty, the step will be skipped.

- Step 6 - Execute Campaign (Content Syndication Asset) - If any of the assets being promoted are associated with an Action Stream, add them to this Execute Campaign flow step. Several assets are already listed. This will call a separate campaign to process the lead so it is properly added to the relevant Action Stream.

- 03 Manual upload processing - No action is required here. This campaign is used if the DAP sync fails.

- Not added to SFDC: This isn't a campaign to activate, but this report will help you track issues with leads being added to SFDC.

- Smart List: In filter 2: Member of SFDC Campaign add the specific SFDC campaigns for this program. Click on green plus sign, then start typing. A list of SFDC campaigns will come up and you can click on them to add them to the list. Click OK.

Step 6: Important information for content syndication list uploads

When you do your list upload, you must be sure that the Asset number] - that corresponds to each asset is included in the Content Syndication Asset field so the automation will trigger, using the format Asset [number] - ("asset number space -"). The recommendation is to populate the Content Syndication Asset field using the format Asset [number] - Name of asset (example: Asset 2 - 2023 Global DevSecOps Report: Security & Compliance). A complete list of current assets with their asset number can be found [\[here\]](#). This also applies if the responses are set directly from the vendor. They must be set-up in the vendor system with the appropriate asset number.

It is critical that any reference to asset number in the upload or send from the vendor uses the format Asset [number] - ("asset number space -"). For example Asset 1 - and Asset 12 -. This allows the automation to select the proper asset since we are using "contains" to trigger the automation. Without the (space) - after the asset number, both Asset 12 and Asset 1 will be recorded as Asset 1. These instructions apply to the "Content Syndication Asset 2" for double touch campaigns field as well.

Step 7: Test the new asset in your Content Syndication programs

Follow the instructions in Step 6 above to test the new asset. Focus specifically on the Add to SFDC Campaign and Interesting Moments to QA a new asset.

Integrate DAP Closed Loop Feedback

Feedback on leads received via the Integrate service is an automated process done via Marketo webhooks, with 7 in total. The smart campaign triggers, smartlist filters and "holding" smart campaigns used for the automation are found on this program. There are three smart campaigns used and for two reasons: The Activation trigger acts as a 4 day holding cell that allows for newly received leads to go through multiple GitLab processes before calling a webhook, e.g. being contacted by SDRs, receiving scoring, being marked as a non-deliverable email. The flow also separates normal leads from test leads and adds normal leads to the static Hold list, which is used for an automated bi-weekly lead quality report sent to Integrate's platform. The second smart campaign, Scheduled Integrate Webhook Calls, is scheduled to run bi-weekly on Mondays. The flow checks the static Hold list for Integrate received leads, triggering the webhook calling smart campaign. The third trigger, Webhook calls, calls the appropriate webhook. Total time for a new lead to run through this process is 4 days after entering Marketo plus whenever the lead has entered into the bi-weekly cadence - so usually 2 weeks but maybe a tad bit longer in some cases.

When calling webhooks, Marketo will timestamp the first webhook call in the Integrate Webhook - First field and if there is ever a second run-through of the webhooks the time stamp will go in the Integrate Webhook - Second field. All leads ran through the webhooks will be added to the static lists found in the Static Checks folder.

The 7 webhook feedback automations we send to Integrate are:

Accepted Webhooks

- Accept: This is a generally accepted lead
- Low: This is also an accepted lead, but we share the feedback that the lead was low quality. This can be for multiple reasons, ranging from the leads being Disqualified to having a very low demographic score

Not Accepted Webhooks

- Bad Data: This should be generally thought of as being similar to a "spam" lead
- Bad Phone: Fired when a SDR marks the lead's listed phone number as not usable or wrong. Integrate can return these leads to us with the phone number corrected, while other return webhooks will cannot be returned
- Bounce: The email address was deemed unreachable by Marketo. Either our emails have bounced

or are being blocked. We cannot accept or use the lead because Marketo cannot determine if the email address is real

- Competitor: The lead is part of a competing company and we are not interested in receiving further leads from this competitor. Use this as an error notification, meaning our lead sourcing filters that needs to be addressed

- Test: When Integrate needs to send us test leads, this webhook will be triggered by those incoming leads. Please make sure the teams sending us leads via the service are aware of the needed filters to trigger the automated feedback via webhook

Steps to Setup Surveys in Marketo and SFDC

Please Note: Once you have created your survey program, please ping Marketing Ops in the mktops Slack channel and link your program for review. Each survey is unique and may require tweaks to the setup.

Step 1: Clone program template

- General survey template
- Use format YYYYMMSurveyName

Step 2: Sync to Salesforce

- At the program main screen in Marketo, where it says Salesforce Sync with "not set", click on "not set"
 - Click "Create New." The program will automatically populate the campaign tag, so you do not need to edit anything.
 - If you are a user of Allocadia, you will need to add the Allocadia ID sub-category ID to the Description field.
 - Click "Save"

Step 3: Create issue for lead upload

- If the survey requires a manual upload via a list upload, focus attention on updating the 01 Processing batch smart campaign. For manual list uploads, the batch will be activated manually by MktgOps during the upload process.
- If the survey requires a Zapier automation, consult MktgOps via issue on building out the automation, MktgOps will also be the ones to activate the 01 processing campaign

Step 4: Update the Salesforce campaign

- Refer to instructions above.
- Add the Marketo program link and SFDC campaign link to the epic.

If utilizing Allocadia, please refer to the instructions above.

Step 5: Troubleshooting

1. Look at the Results tab of the smart campaign, if there are errors, you will clearly see them there.

1. If the lead is not pushing to SFDC? Make sure that the Person Source is not SurveyName

1. If existing leads are not being pulled into the program, it is likely the SurveyName field is capturing the wrong name.

1. If net-new leads are not being pulled into the program, it is likely the Person Source SurveyName was not updated correctly.

Steps to Setup Direct Mail Campaigns

Step 1: Create the Salesforce campaign

- Clone the TEMPLATE - Direct Mail
- Update Campaign name to whatever your campaign tag is
- NOTE: You do NOT need a corresponding Marketo campaign. All information and tracking is done via this campaign.

Step 2: Update the Salesforce campaign

- Click on Advanced Setup to make sure statuses correspond to those listed in the Direct Mail progression statuses. Do not edit these, if you need them updated, please reach out to MktgOps.
- Confirm the type is Direct Mail
- Refer to instructions above.

Steps to Setup LinkedIn Lead Gen Form

We have listeners set up in Marketo listening certain parameters. Please check the Marketo Listener column below to see if a program is already set up in Marketo. If it is, you do not need to create a new listener, you only need to add the content to the program. Otherwise, please follow the process outlined below to ensure leads are being captured.

Active or in progress campaigns

Campaign Listener?	Campaign Parameter for Tracking	Marketo
DevOps GTM - active	devopsgtm	Yes
AutoSD - active	autosd	Yes
DevSecOps Platform - Security & Compliance	devsecopsplat	No
CI Use Case	seccomp	Yes
PubSec - DevOps GTM only	singleappci	Yes
	amer-pubsec	Yes

Deactivated or old campaigns, no longer in use These listeners are no longer active and would need to be set-up prior to running a LinkedIn campaign for them.

Campaign Listener?	Campaign Parameter for Tracking	Marketo
Version Control & Collaboration Use Case	vccusecase	
Simplify DevOps	simplifydevops	

Jenkins	cicdcmp2		
Increase Operational Efficiencies	operationalefficiencies		
Deliver Better Products Faster	betterproductsfaster		
Reduce Security and Compliance Risk	reducesecurityrisk		
CI Build & Test Auto	cicdcmp3		
OctoCat	octocat		
DevSecOps Use Case	devsecopsusecase		
AWS	awspartner		
GitOps Use Case	iacgitops		

If this form is in a different language, make sure that the LinkedIn Form has that exact language in the form name (as spelled below). We currently support:

- Japanese
- Italian
- French
- Spanish
- Korean
- German
- Portuguese

When someone fills out these forms, they will be automatically added to the Language Segmentation allowing them to receive messages in their local language.

Create LinkedIn Lead Gen Form in LinkedIn (digital marketing)

- Clone the form template according to the region your campaign is located (AMER, EMEA/APAC). The reason for the different forms is compliance related, so please be sure to use the correct template for the region. If you are setting up all three regions, you will need to use both templates.
 - Ensure the 'form name' includes the utmcampaign exactly as it appears in the table above
 - Form name should also include the utmcontent exactly as listed in the issue
 - Form names in AMER forms also need to include amer in the form name
 - Example of correct format
 - Ex.devopsgtmamerguide-to-devopsfeb2023
 - NOTE: If there is a segment specific version, add the segment inside the content name for better tracking. devopsgtmamerguide-to-smb-devopsfeb2023...
- Fill out 'offer headline' and 'offer details'
- Update 'confirmation message' and landing page URL
 - The template has the homepage as a standard landing page URL, but if there is a more appropriate page, update the URL and keep the UTMs the same
- Update hidden field for utmcampaign and utmcontent
 - This is very important to have the correct campaign naming to ensure the lead data is passed to Marketo
- Save Form
- Navigate to the campaign that will be using the new form and edit
- In form details select download as the call-to-action and select your new form
 - Note: If your new asset is launching in multiple regions, confirm you're adding the correct form to the correct regional campaign

Step 1: For new campaigns not listed above

clone this program

- Use format YYYYSocial[Name][parameter]LinkedIn Lead Gen
- Campaign parameter must be one of the GTM campaign parameters (usually used as utmcampaign - ex. devopsgtm or autosd). The Salesforce campaign name must include the campaign parameter for the responses to roll up to the correct campaign on the Sisense dashboards.

e.g.: 2020SocialAutomatedSoftwareDeliveryautoSDLinkedIn Lead Gen

Step 2: Sync to Salesforce

- At the program main screen in Marketo, where it says Salesforce Sync with "not set", click on "not set"
- Click "Create New." The program will automatically populate the campaign tag, so you do not need to edit anything.
- Click "Save"

Step 3: Update the Salesforce campaign

- Add Parent Campaign of 2020SocialLinkedInLead Gen
- Refer to instructions above.
- Add the Marketo program link and SFDC campaign link to the epic or issue.

Step 4: Go back into Marketo Template

- Update local program tokens. Note: The template is set-up for one asset per form. If you have multiple assets, you can add additional tokens for each asset.

Smart List

- Update the campaign smart list filter with contains and the prefix
 - Fills out LinkedIn Lead Gen Form, Lead Gen Form Name contains [parameter]
 - Available parameters are listed above, or create new if not listed.
- Filled out LinkedIn Lead Gen Form filter - Make sure that other programs are excluded if your new campaign will use a similar LinkedIn Lead Gen form name. Common exclusions are amer-pubsec and abmkeyas these flow through separate campaigns. This is not a full list of all exclusions required as this will be based on what you are setting up. You can review existing LI Lead Gen programs for examples of exclusions.
- Other programs are looking for the parameters listed above. If your LI Lead Gen form contains any of these, you will need to exclude your campaign from the existing program processing (for example, if your LI Lead Gen Form contains devsecopsusecase, you will need to exclude your LI Lead Gen form name from processing through the others that use devsecopsusecase). Please see the testing section below as this provides instructions to make sure you captured exclusions properly. Note that the ABM Team runs LinkedIn campaigns using abmkey and the campaign parameters above, so abmkey must always be excluded.

Flow

- No change to 1 - Remove from Flow - If you remove this temporarily to test, be sure to add it back in before going live. Remove from Flow: Choice 1: If Email Address contains @gitlab.com. Campaign: this campaign. Default Choice: Campaign is Do nothing
- 2 - Send Email - This step will vary. In general, you will set Choice 1: If Filled out

LinkedIn Lead Gen Form contains content name from form] then, Email [select appropriate email autoresponder]. You can have multiple choices here, one for each asset. Even if you only have one asset, best practice is to set up a choice with the default of Do Nothing. This is another backup in case the automation fails and will make sure that people don't receive an autoresponder email for another asset because the content name won't be found. You can view an example with multiple assets [here].

- No change to 3 - Change Program Status - This is automatically in the template. Program: [Marketo program name] - New Status Paid Social > Responded

- 4 - Interesting Moment Set this up the same way as the Send Email logic, except you will change the description to match the asset. In general, you will set Choice 1: If Filled out LinkedIn Lead Gen Form contains [content name from form] then, Type Milestone, Description: Filled out LinkedIn form to view asset: [asset name]. Default choice should be generic: "Filled out LinkedIn form to view [GTM name] asset."

- If you set up additional tokens for each asset, you can use the tokens to populate the Interesting Moments

- No changes to steps 5 and 6.

- Step 7: For EMEA or APAC: 7 - Change Data Value - Delete this step. Those forms use a checkbox to gather consent, so the correct opt-in status will be applied upon submission and this step cannot be included in the flow.

- Step 7: For AMER: 7 - Change Data Value - No change. Keep this step. In AMER, the opt-in language is included on the form, so this step is required to complete the opt-in.

- Step 8: Execute campaign - This processes Action Stream tagging. No action required on this step. This should be: Executed Campaign: Action Stream tagging: (LinkedIn) Check Asset

- Turn on / Activate the triggered campaign in the schedule tab of the smart campaign

- All LinkedIn programs with your form prefix will now flow through this campaign

- If your new form promotes an asset that qualifies for an action stream, click on the Action Stream tagging: (LinkedIn) Check Asset program. Otherwise, skip this step.

- Smart List: Add the name of the LinkedIn Lead Gen form in filter 1.

- Flow: Add the name of the LinkedIn Lead Gen form in filter 1.

Step 5: Auto-responder email

- The autoresponder is based on tokens and will not require any changes if you only have one asset.

- If you have multiple assets, you will need to clone the autoresponder email and update all of the tokens in the email to match the additional tokens you added to the program for each asset.

Step 6: Test your LinkedIn Lead Gen Set-up

- Have Digital Marketing send a test record through the form. You can request this in the issue using the following text, updating the indicated sections: The Marketo program has been set-up for [name of asset] in [segment/region if applicable - you will not always need to provide this]. The automation will trigger based on [gtm code] and [content name]. Please submit a test record.

- After the test lead is submitted, open the test record in the Marketo database. Go to the Activity History and confirm:

1. The form that was submitted. You will pay attention to the gtm name and the content name. Make sure this is the form you wanted to test. If confirmed, move to step 2.

1. Confirm the correct autoresponder for the requested asset deployed (digital)

1. Confirm that no other autoresponders were sent (campaigns)

1. Confirm that the correct Interesting Moment was triggered (campaigns)
1. Confirm that the test record was added to the SFDC campaign (this may take a few minutes) (campaigns)
1. Confirm that the test record was not sent any other emails or added to other programs as a result of this test (campaigns)

Step 7: Update this Handbook page

- Update this handbook page with the parameter with a yes and a link to the parameter and campaign you have set up.

Test your Marketo program setup

1. Submit a test registration on the webpage for this campaign. If you need to create a new test record (instead of using your existing email address), you can add a + after your username: for example jdoe+testuser@gitlab.com. When you run your test, pay attention to if the flow has a "Remove from flow" for GitLab email addresses. If this is the case, you need to either delete that flow step or test with another email address.
1. After the test lead is submitted, go to the Marketo database by clicking Database in the Marketo navigation. Then click on Default on the left side menu.
1. Search for the email address you used for your test record and open the test record in the Marketo database. Go to the Activity History and confirm:
 1. The form was submitted
 1. The record was added to the correct program with a successful status (should not be No Action)
 1. Confirm the correct autoresponder for the requested asset deployed
 1. Confirm that no other autoresponders were sent
 1. Confirm that the correct Interesting Moment was triggered
 1. Confirm that the test record was added to the SFDC campaign (this may take a few minutes)
 1. Confirm that the test record was not sent any other emails (except double opt-in email for Germany if applicable) or added to other programs as a result of this test

Adding LinkedIn Lead Gen forms to drive event registration

LinkedIn Lead Gen forms can be used to drive event registration without adding a new Marketo program.

- 1) Follow the instructions above to create the LI Lead Gen form. There are a couple of changes you must make to be sure the responses only flow through the event registration processing and not the standard LI form processing.
- 2) For ABM LI Lead Gen forms, use the naming convention: abmkeyregiongtm for driving event registration. The standard (non-event) format is abmkeygtmregion. By changing the order of region and gtm, you will not need to add exclusions to the main LI Lead Gen form processing.
- 3) For Digital Marketing forms, do not use the gtm in the form name. Use a unique name that represents the event.
- 4) In Marketo, go to the Marketo program for the event you are promoting.
- 5) For most events, we recommend setting up a waitlist for responses from LinkedIn. This allows the event DRI to approve registrations. If a waitlist processing campaign is already activated in the program, you can skip to step 6.

- a) ONLY DO THIS IF THE WAITLIST PROCESSING IS NOT ACTIVE: If only the Registration processing campaign is active, you will need to activate the waitlist for LI responses. Click on Waitlist and remove the "Filled out form" trigger. Now, complete the task in step 6 and activate the Waitlist campaign. You must also activate the "Waitlist to Registered" campaign.
- 6) Add a trigger for "Fills out LinkedIn Lead Gen Form". Lead Gen Form Name: contains (enter Lead Gen form name you created in step 1 here). If you have multiple forms for this event, you can click the green plus sign in the box after contains and add multiple forms.
- 7) If your form is only targeting AMER responses, click on the "Flow" steps and at the bottom, add "Change Data Value". Add Choice. If LinkedIn Lead Gen Form name contains (name(s) of LI lead gen form). Attribute: Opt-in, New value: True
- 8) Test your updates. Details for what to look for can be found in the Test your Marketo program setup - Note that when a person is added to the waitlist, they will not get an autoresponder, but you will see them added to the program.
- 9) If you have any questions or just want your set-up checked over, please reach out to Marketing Ops before pushing your campaign live.

Raffles

Raffles can be associated with many different campaign types and have various ways to enter. You must complete the legal requirements before launching your raffle.

In general, the YYYYMMDDSurveyName Marketo program and Survey Campaign type will be used for raffles. Due to the potential set-up complexities for raffles, Marketing Ops will need to be involved even if you use the instructions below. Use these instructions to create the program and to engage Marketing Ops for additional set-up or review.

For a Raffle Update Smart Lists, Flows and Tokens

- Clone the YYYYMMDDSurveyName
- Name the program using the following syntax: YYYYMMDDNameofProgramRaffle. You will likely have another campaign type associated as well (for example, a Conference) and this program should be housed in the folder for that event. This is a similar process to creating a speaking session associated to a conference.
- Sync to SFDC at the program main screen in Marketo, where it says Salesforce Sync with "not set", click on "not set", Click "Create New." The program will automatically populate the campaign tag, so you do not need to edit anything except click Save.
 - If you are a user of Allocadia, you will need to add the Allocadia raffle line item ID to the Description field. Click Save.
- Update the SFDC campaign and associate it to the parent campaign where applicable.
 - If you are a user of Allocadia, please see instructions here.
- Go back to the Marketo program and complete the tokens. Update the {{my.Survey Name}} token with the word "Default" - do not use another entry on this token.
- If you are using a landing page: Update your Registration page, thank you page, and registration confirmation email.
- If you are using a landing page: Click into the 01a Registration Flow and change the Smart List to "Form Name is any" and "Web page is" should already be populated with the registration page for this program. The Flow should already be populated for you, but update Step 5 - Interesting Moment to read: "Filled out form to enter raffle {{my.Survey Title}}" in the Description field of Step 5. Go to Schedule and click "Activate".
- Responders to the form will be added to the program and SFDC campaign as Filled out Survey

and will be scored according to the Survey - Low entry in the scoring model.

- Due to the potential set-up complexities for raffles, Marketing Ops will need to be involved.

You can add the MktgOps::00:Triage and MktgOps-Support labels to your Marketo LP and Automation issue for assistance with set-up.

- If you are not using a landing page, MarketingOps will help you determine the correct processing for this campaign.

Updating Member Statuses for Owned Events from Marketo Programs

Once an Owned Event (that included a GitLab-run landing page where we collected leads) is complete, DRIs are able to update the member statuses directly from Marketo, versus submitting a lead list upload. NOTE: This is ONLY for status changes. If you have notes to add to leads, you will need to submit a lead list upload.

1. Log into Marketo and click into the appropriate program for your campaign
1. Click on the Members tab at the top of the page
1. Click on the line item for the member that requires a status change
1. Select Change Status at the top of the screen
1. Select the appropriate status in the drop down (Attended, Follow up Requested, No Show, etc.)
1. Marketo will take a few moments to adjust the status and then the status will be updated

Removing Registrations from Marketo Programs

Once a landing page has been set up for a campaign, it is good practice to have multiple people test the registration to make sure everything is integrated and running properly. As a result, there are often various test registrations in the Marketo program. To remove these test registrations, follow the below instructions.

1. Log into Marketo and click into the appropriate program for your campaign
1. Click on the Members tab at the top of the page
1. Click on the line item for the member you wish to remove and make sure that line item is highlighted
1. Select Change Status at the top of the screen
1. Select Not in Program in the drop down
1. Marketo will take a few moments to adjust the status and then the name will be removed from the Members list

Removing SPAM from Marketo Programs and Zoom

On occasion, SPAM bots attack our webcast registration. Follow these steps to remove from Marketo and SFDC. You must open an issue with Mops to complete. Please include the marketo program link in your issue request and the dates of the event. The SPAM registrants will not be removed from zoom, and will need to be manually removed. However, it is OK to leave them in the zoom campaign, because it will not affect your campaign numbers.

1. Find the program in marketo
1. Isolate the SPAM and add them to a newly created static list.
1. Remove the SPAM from the program, by Select All in the static list. Then right clicking then Marketing > Change Program Status. Choose the Campaign and update the status to Not in Program

This will also remove them from Salesforce.com campaign

1. Go to your static list. Highlight all and Delete Person
1. Agree to popup, and also remove from SFDC.

After program ends, double check your Marketo program for SPAM, as people that registered (but were excluded from registration filters) would be added to program as No Action because the form is a part of that program. Re-run the steps above to fully remove them from any campaign stats.

Canceling an Email send

There are cases where an email is set to send, but you need to cancel it. There are a few ways to do this based on the type of program.

Smart Campaign - Scheduled Send

1. You can cancel specific runs by going into the smart campaign > schedule and clicking the red x next to the date and time of send.
1. To cancel the entire run, go into the smart campaign > schedule > campaign actions > Abort Campaign .
 - You can still reschedule the send after you abort it

Marketo documentation:

- Stopping campaign runs
- Aborting campaign

Smart Campaign - Triggered Send

1. If the campaign is running on a triggered basis, you should go into the smart campaign > schedule and click the deactivate button. This will stop any lead from qualifying from the campaign again.
1. If the campaign is running through multiple flow steps, in order to halt the leads from continuing in the flow, you must go into the smart campaign > schedule > campaign actions > Abort Campaign. This will stop leads from continuing in the flow, and stop any further emails from being sent out.

Marketo Documentation:

- Deactivating a smart campaign
- Aborting a smart campaign

Email Batch Campaign

This program type has a mailbox icon.

1. If a campaign is scheduled, but hasn't sent yet. Click into the main program (mailbox) and view the control panel. You'll see 4 boxes. In the bottom right box, click unapprove and the email will not go out. When you are ready to reschedule, update date and time, and click approve in the bottom right box. All boxes will have a green checkmark signaling it is ready

for send.

1. If a campaign is actively sending and you want to stop it, click into the main program (mailbox) and in the bottom right box click Abort Program. This will stop the sending of emails, but will not recall any email that was already sent. You will see how many you send in the dashboard view. Once an email program is aborted, you cannot reschedule it again.

You can view screenshots and further documentation from Marketo here:

- Aborting an email program
- Unapproving an email program

Instructions: How to update Conferences with more than 5,000 attendees

For conferences list loads with more than 5,000 attendees, consider not marking them as success. If the acting Field Marketing Director agrees to avoid marking these members as success, these are the steps to avoid that from happening. This can only be done by a member of the MktgOps team!

1. Open Marketo, Navigate to Admin>Tags>Channel>Conference
1. Uncheck Success box for Attended and save
1. Load the list in with the attended members
1. Once the list is done processing and campaign members are added, go back into Admin>Tags>Channel>Conference, and recheck the Success box for Attended

Instructions: How to collect Dietary Restrictions on event registration and view responses

1. For an owned event (Field Marketing), add FORM 4286: Owned event with Dietary Restriction to the LP. Note that we do have other forms that collect this data, for example DevSecOps World Tour forms. Check with MOps if you aren't sure which form to use for your use.
1. Update Smart Campaign to look for FORM 4286 in the Registration Processing SC.
1. Create a smartlist to look for the responses from the form. From the program, click "New", then "New local asset", then "Smart List". Name the smart list "Dietary Requirements". Add the filters Member of Program (Program name) & Dietary Restriction Details (is not empty).
1. Next, you need to create a custom view in Marketo to see the details. Once you create the view, you will always have it available for selection the dropdown.
1. Click on the Dietary Requirements smart list you created, then go to the People tab.
1. Click where it says View: Default
1. Select Create View
1. Name the view Dietary Restrictions and under hidden columns, select Dietary Restriction Detail and Dietary Restrictions: Other
1. Click Create
1. Note that you can follow the same steps above if you need to view Physical Accommodation requests in a Marketo report. The fields for this are Physical Assistance Needs and Physical Assistance Detail.

The view you created will be saved for future use, so any time you need to see this specific view in the future, you will click View: Default and select "Dietary Restrictions" from your dropdown (the list is unique to you, so you will have different options than other people). Due to privacy requirements, we are not pushing this information to SFDC, but you can see it in Marketo up until seven days after the event. The dietary restriction fields will automatically

be cleared 7 days after the lead list is loaded.

SECTION: marketing/marketing-operations/cognism.md

About Cognism

Cognism is sales intelligence software that provides contact or account data helping sales and marketing teams drive predictable pipeline

Set Up

Once you receive your login and enter the Cognism platform you will need to download the Cognism Chrome extension. You can also find the link for the Cognism Chrome Extension by following this link.

Connect your tools

Once you are logged in into your Cognism Web-App, start by connecting your tools (Salesforce & Outreach). This will allow you to export leads to both tools.

Even though this process is very straight forward, feel free to reference the How to Integrate Cognism to Salesforce and How to Integrate Cognism to Outreach documentations if need be.

Ways to access Cognism

Your direct login allows you to login in either the Cognism Web App or in the Cognism Chrome Extension. Both can be used to access the Cognism data. Additionally, Cognism data is populated directly into our SFDC instance, on the Cognism fields for the leads that meet the criteria to be automatically enriched or, on the leads that have been exported manually from the Chrome Extension or from Cognism Web App.

Who can use Cognism at GitLab?

For the moment, the Cognism Web App and the Cognism Chrome Extension are only used by the Sales Development Organization and specifically by the BDR role. We do allow for temporary licenses outside of the BDR role if we have them available, however, the temporary license will get revoked as soon as a BDR needs it.

The Cognism data that was enriched on specific lead records, however, can be viewed by anyone by just checking the Cognism fields on the lead & contact objects.

Note, we redistribute inactive seats to new Cognism users. Any users who have not logged in to Cognism in the last 2 months are at risk of losing their seats. If you wish to keep your Cognism seats, please be sure you are regularly logging in and using the platform.

Training

Both the Cognism Web App and the Cognism Chrome Extension are self explanatory and very user

friendly, however, Cognism does provide additional videos that can be viewed to get familiar with the tool.

Title	Duration	Summary
Cognism Chrome Extension Intro	2:04	A general overview of the Cognism Chrome Extension
Cognism Chrome Extension Workflow	1:13	Cognism Chrome Extension Workflow Examples
How to Use Cognism for Sales - Product Tour	10:40	Cognism Platform Product Tool
How to Use Cognism for Marketing	04:19	How to use the Cognism platform to power-up your marketing engine

SFDC Field Mappings

With Cognism, we're only enriching Cognism custom fields so the mapping reflects this. You'll find these fields by looking for [Cognism] in their field label name. On the lead & contact layouts, you'll find the Cognism Section, right below the Zoominfo Section.

If you have concerns about field mapping or you notice that some of the fields do not get enriched as expected, do reach out to Marketing Operations.

Do Not Call and Do Not Email Automation

If the proper criteria is set, Cognism can cause a lead/contact in SFDC to be labeled as Do not email and Do not call. Read more about the rules on the sales development handbook page.

Outreach Integration

The Cognism Outreach integration is live and you may export contacts directly to Outreach. Any contacts you do export, will also be exported in SFDC.

There are some limitations in place:

- We do not allow for new accounts/account updates from Cognism into Outreach.
- Please do not upload any contact without an email address into Outreach- if you do, the prospect will not sync into SFDC and any activities you do on the prospect will not be recorded in SFDC.
- Any prospects created without email address will be found and deleted in the Outreach database management we will run monthly. To avoid uploading contacts with no email addresses, please use the Cognism filtering available.

Use of Cognism Enhance feature to enrich lead list uploads without email

There are situations where list uploads, obtained from various events, do not have an email and, therefore, cannot be uploaded into our SFDC instance. To bypass this challenge, we use the Cognism Enhance feature. It only needs certain data points (First Name, Last Name, Company Name) to be able to fill in the rest (Email).

If your lead list does not have is missing the email data point, feel free to open a Mops project with this issue template, fill in the needed details, and the missing data will be added for those leads that match to Cognism's database.

NOTE: All leads that have been enriched with email information, are, by default, opted out of email communication. These are not opted in and we can only reach out if we get the proper express consent.

Cognism <> Openprise Automated Enrichment

Using Openprise and the Cognism API Key, we're able to leverage our Cognism Credits and automatically enrich salesforce records on a daily basis. Once the record meets the below criteria, it is added to the enrichment queue and automatically enriched if it matches Cognism's database.

The current enrichment criteria is the following:

1. Owner Profile contains SDR, Sales Development AND Initial Source equals AE Generated, Cognism, DiscoverOrg, Email Request, etc., Lead Status equals Accepted, AND Created By not equal to Marketo Integration, Outreach Integration;
2. Last Interesting Moment Date equals Last 30 Days AND [PQL] Product Qualified Lead equals True AND [PTPT] Score Group equals 4,5;
3. Initial Source equals Zoominfo AND (Phone equals blank OR Email equals blank) AND Demographic Score greater than 59;
4. Initial Source equals Request - Contact AND (Phone equals blank OR Email equals blank) AND Lead Owner does not contain disq,inel,jihu.
5. Lead Status equals MQL, Accepted, Qualifying AND Vartopia Partner Account equals blank AND Campaign Field - Member First Responded Date equals Current FY AND Campaign Field - Campaign Type equals Trial AND [Cognism] Automatically Enriched equals False AND Account Demographics: Region equals EMEA.

Cognism Licensing Policy & Procedures

Administration

Cognism management is exclusively done by the Marketing Operations team. We currently have 70 seats for Cognism, seats which are all dedicated to the Sales Development Org and specifically to BDRs. Outside of the BDR roles, we only allow for temporary licenses, for other roles, when such a license is not needed on the BDR side.

Access & Help

BDRs receive access to Cognism as part of the onboarding process. If the team member did not receive access or if access has been removed and you would like it back, you will need to open an individual access request.

If you are experiencing issues with Cognism, feel free to chime in mktgops slack channel and ask for help. You can also reach out to Cognism directly at help@cognism.com

Monthly License Review

Due to the limited seats available, licenses will be reviewed on a monthly basis to ensure alignment with our policy. Our current policy states that for an active, non-admin license will be flagged for review it needs to meet the criteria below:

1. It must be integrated with both SFDC & Outreach;
2. A minimum number of more than 10 profiles have been viewed in the last 3 months;

Before a license is deactivated, Mops will reach out to the user and confirm if they still need access to the platform. If they do not need access, then the user is removed from Zoominfo. Please note that even if the user access is removed, they are still able to see the Cognism field data in SFDC.

Detailed Process

1. Log into Cognism, Dashboard, User Activity Section;
2. Check users for the criteria above;
3. Reach out to users on Slack;
4. Deactivate users who no longer need access; (A lack of response will be considered as if the license is not needed)
5. Create an issue in Mktgops Project, keeping track of the users who have been deactivated. The label Mktg Tool Audit will be used.

If a temporary license is assigned to a non-BDR role it can be revoked at any time if it's needed for a BDR Role.

Pending Invites

Pending Cognim Invites have to be accepted in the time-span of a week because they block licenses from being assigned. If, after a week, the invite is still not accepted, it will be cancelled. Another invite can be sent out if requested through an individual access request

SECTION: marketing/marketing-operations/iconik.md

About

Iconik is a media asset management and video collaboration platform used by the Brand Video Team to manage video workflows, metadata, cloud storage, and collaboration.

Access

Access is limited based on use case as it is used specifically and primarily by the digital production team. All requests will be vetted by marketing operations and digital production to determine justification for access. For contractors working on behalf of the digital production team, please follow the access request process.

Support

1. iconik-support@iconik.io

Overview

Iterable is a powerful email marketing automation platform that allows us to create, send, and track personalized email campaigns. It provides a user-friendly interface and a wide range of features to help us engage with our customers and users effectively.

Iterable Journeys

Journeys are a powerful feature that enable us to create complex, multi-step customer engagement campaigns. With Journeys, you can design personalized customer experiences across multiple channels, including email and SMS. Map out customer journeys, set up triggers and conditions, and deliver targeted messages at each step of the customer lifecycle.

List of journeys implemented:

Journey Name (Folder)	Link

SaaS Trial Onboarding + Post	Link
Free User + Invited Onboarding	link

API Custom Events

Iterable's API is designed to handle large volumes of data and high request rates. It ensures scalability and reliability, allowing us to deliver personalized messages to in-product user segments.

```
mermaid
graph LR
  GitLab.com --> CustomersDot
  CustomersDot --> Workato API
  Workato API --> Iterable
```

SaaS Trials Event

The SaaS Trials event in Iterable, represents the action of a user signing up for a GitLab SaaS trial. The trigger is sent from CustomersDot to Workato and then to Iterable. Data fields sent over upon a trial sign-up are used to segment users in Journeys.

Data Fields		Data Type
company	Fictional Company	String
companyNamespace	true	Boolean
country	United States	String
employeeBucket	1-99	String
firstName	John	String
lastName	Doe	String
latesttrialstartdate	2023-06-11	Date
signupReason	I want to explore GitLab	String
state	OR	String
userRole	productdesigner	String

SaaS Free Registration

The SaaS Free registration event in Iterable, represents the action of a user signing up for a free GitLab account. We only capture send this event if the user has chosen to setup their account for a team or company. We are not currently syncing personal signups.
