

If you are not already in that channel, please ask a Marketing Ops team member to be added if you need access to our Qualified team.

To request a new feature or change please use this issue template in the Marketing Operations project.

Other Qualified Features

Smart Forms

Using smart forms with Qualified allows your existing lead capture form to qualify leads on-the-fly and route your most qualified visitors to your sales reps in real-time.

Traditional lead forms often come with the expectation that visitors coming to your website will have to wait hours or days to talk to your sales team. Smart forms allow you to alert your reps in real-time to those hot prospects on your site ready to talk with sales, or book a meeting with your sales team for a later time.

To request a new smart form please use this issue template in the Marketing Operations project.

Smart Buttons

The Smart Button changes CTAs from a static one-size-fits-all form to a bespoke buying experience. When visitors meet your ideal customer profile, trigger a real-time sales conversation with your sales team to open the door to a dynamic two-way conversation. This gets buyer questions answered in real-time and helps your sales teams instantly capture more pipeline.

To request a new smart button please use this issue template in the Marketing Operations project.

About Ringlead

RingLead is a SaaS application designed to enable sales and marketing to become efficient and productive.

The Ringlead platform orchestrates Salesforce and Marketing Automation processes like managing duplicates, data normalization, segmentation, enrichment.

As an introduction, below are a few items that will help with using the platform and understand how their tools help us reach our data goals.

Product	Overview	Feature	Description
Cleanse	Cleanse your database by removing costly duplicates or hundreds of custom object records while creating data records that are standardized and easily update with Cleanse.		
	www.help.zoominfo.com/lightning/articles/help/Overview-of-Salesforce-Deduplication-Best-Practices Overview of Salesforce Deduplication Best Practices		
	Scan your database for duplicates based on specific criteria that you define. Once you've identified your duplicates, easily merge them saving you storage costs and time.		
	www.help.zoominfo.com/lightning/articles/help/Overview-of-Normalization-Rules-in-RingLead Overview of Normalization Rules in RingLead		
	Standardize your addresses, websites, phone numbers, and more to keep data easy to navigate and search on		
	www.help.zoominfo.com/lightning/articles/help/How-to-Create-and-Run-a-Mass-Update-Task How to Create and Run a Mass Update Task		

Update fields on custom and standard objects after filtering and defining your new values

How to Mass Delete Leads with Last Activity Greater Than 2 Years

Clean out your Salesforce by deleting custom and standard objects

Enrichment	
	Make the most out of the data you have and fill in the gaps where you don't. Company firmographics and contact data can be completed and updated with this tool. Use your existing vendor, or let us help you find the best data from any vendor.
	How to Perform Salesforce Mass Enrichment
	Enrich records directly from any data vendor.
	FormComplete Made Easy
	Allow web form users to spend less time entering data with a RingLead powered address search right on your form

Enrich data using a data vendor outside of RingLead.
--

Recommended order of operations

1. Lead Deduplication (Completed & Automated - runs weekly on Saturdays)
2. Account Deduplication (Taking place using Openprise as the tool of choice and is run by Sales Operations)
3. Converting Leads to New Contacts (This step is skipped in our case since it would impact sales workflow considerably. We will re-evaluate if the sales team is not as heavily focused on leads as we are now.)
4. Contact Deduplication (Completed & Automated - runs weekly on Saturdays)
5. Lead to Contact Deduplication (Final Testing is worked on as we speak with go live date scheduled for end of Q3 FY25)
6. Deduplication of Custom Objects (only if needed)

Account Deduplication

Account deduplication is currently being managed by Sales Ops. The deduplication job applies for Prospect Accounts w/o ZI Company ID and runs weekly every Saturday at 12:00 PDT.

Lead to Lead Deduplication

Lead to Lead deduplication is managed by Marketing Ops and is taking place on a weekly basis on Saturdays. From the deduplication job certain lead records are excluded, as follows:

- Records that have a value in the Vartopia Partner Account field;
- Records that are actively being sequenced;
- Records which status is Qualifying or Qualified;
- Records for which either the Last Name or Company Name is [[unknown]]

Contact to Contact Deduplication

Contact to Contact deduplication, as the lead to lead deduplication, is managed by Marketing Ops and is taking place on a weekly basis on Saturdays. From the deduplication job certain contact records are excluded, as follows:

- Records that have Account Type = Partner;
- Records that are actively being sequenced;
- Records which status is Qualifying or Qualified;
- Records for which either the Last Name or Account Name is [[unknown]]
- Records that are flagged as being on an open quote using the On Open Quote checkbox;
- Records that are marked as current customers with the Current Customer checkbox;

Lead to Contact Deduplication

Lead to Contact Deduplication is in its final testing phase and is expected to go live in Q3 FY25. For the lead to contact deduplication, the same filtering criteria will be followed.

Custom Object Deduplication

Once all the standard fields have been deduplicated in the correct order of operations, we can move to custom object deduplication to make sure all our custom objects are clean and duplicate

free as well.

SECTION: marketing/marketing-operations/terminus-email-experiences.md

Uses

Terminus Email Experiences is a marketing tool used as an advertising channel inside the inbox (formerly known as Sigster).

Training & Help

1. Knowledge base

- 1. Admin role training pt. 1 - Overview, features and integrations
- 1. Admin role training pt. 2 - Setting up a Terminus campaign

Employee preference center

If you would like to update the information in your signature, simply login to Terminus Email Experiences using your credentials. If you have any difficulty with this method, please post in mktgops and we will send you an email to update your information.

Account Settings

Roles

Only admin users can create campaigns. Only the account owner can add admin users to the platform.

Admin

From this tab you can view the account owners and admins, set company signature field defaults, set default UTM parameters, and change the default account time zone.

Recipients

On this tab, you can define the email recipient domains who will receive any campaign designated as internal. This is currently set as gitlab.com.

Transfer ownership

To transfer account ownership, the owner must login and navigate to Account Settings > Ownership. From this page, click the Pick New Owner drop down, select the person whom you will be transferring ownership to, then select Transfer.

Security

Change password or view API keys for third-party integrations.

Integrations

Salesforce

The integration between Terminus Email Experiences and Salesforce allows marketers to:

- 1. Sync campaigns lists from Salesforce into Terminus Email Experiences for use in targeted campaigns
- 1. See which open and closed opportunities have been influenced and generated by campaigns
- 1. Track which email recipients click on a campaign and how often on an account and contact level

Outreach

Terminus Email Experiences appends campaign banners to Outreach signatures every 24 hours. If they are changed from Terminus, campaign banners in Outreach update in real-time. There must be an employee in Sigstr with an email address that matches the user or mailbox in Outreach in order for a campaign banner to be appended.

Gmail

Terminus Chrome Extension

- 1. Target individual accounts and contacts with personalized campaign content through targeted campaigns
- 1. Provides insight into who is engaging with your email campaigns and how often
- 1. Offers alternative campaign options for employees looking for more control of the content they share

Instructions for install:

- 1. Click this link
- 1. Click Add to Chrome
- 1. Click Add extension
- 1. Ensure the extension is visible in your Chrome browser by clicking the puzzle icon in the top-right corner, navigate to Terminus Chrome Extension, and click the pin icon to pin it.
- 1. Once pinned in your browser, navigate to Gmail and do a hard refresh (Hold · Shift and click the Reload button. Or, hold down · Cmd and · Shift key and then press R.)
- 1. Compose a message then click the Terminus icon. Here you will see a list of available campaigns that you can switch out within Gmail for your purposes.

Please note: The campaigns you will see or not see depend on which employee group you are a part of and the settings of those particular campaigns. If a campaign has not been set up as an Alternate campaign, you will not see it in this view. Likewise, if you are part of a specific employee group or you are targeting an account or prospect that is part of a Targeted or Sender based campaign, your default banner would likely fall under those respective settings. This extension applies to emails sent from Gmail only.

PathFactory

Each campaign banner only points to one link. With PathFactory, you can use one link while providing additional content for the recipient to consume.

You can identify who clicks on your email signature banners and track content consumption using PathFactory. Using these insights you can optimize your email signature campaigns and content tracks, while simultaneously identifying highly engaged prospects.

To take the most advantage of this integration, pair your banner campaign with an equally targeted content track. This v1 integration allows Terminus to pass a visitor's email address to PathFactory whenever someone clicks on a banner. This means that anyone entering a content track from a banner will be identified in PathFactory analytics. When using this integration and sending an email with a banner to one recipient, when that recipient clicks on the banner Terminus will pass the recipient's email address to PathFactory. This allows PathFactory track the resulting session of the known individual. When there are multiple recipients of a single email Terminus handles identifying visitors differently depending on the scenario.

Here are three different possible scenarios:

- Scenario 1: You send an email to multiple people within one organization (all with the same @domain.com)
 - The visitor sessions will be listed as unique events, but the email address "somebody@domain.com" will be associated with each visitor session
 - The email address will actually say "somebody", and the @domain.com will be the domain you sent the email to
- Scenario 2: You send an email to one external person, and one or more internal people
 - The external recipient's email address will be associated with their session data
 - The internal recipients' email address will be listed in PathFactory as unique events from unknown traffic
- Scenario 3: You send an email to multiple people with different domains
 - Eg. tim@example.com, sarah@demo.com, and lisa@xyz.com
 - No email address will be passed to PathFactory, so the visitors' sessions will be listed as unknown traffic and will not have an associated email address

Read more about the partnership between PathFactory and Terminus [here](#).

Adding a PathFactory track to a banner

The demand generation and account-based marketing teams are primarily responsible for the campaigns that are created and used within Terminus Email Experiences. In an effort to stay aligned with our go-to-market plan, please work with your appropriate campaign manager to request a PathFactory track and/or Terminus campaign.

1. Follow the normal procedure for creating a campaign.
 1. Once you are at the step for adding a link to your banner, select the URL dropdown and choose PathFactory Experience.
 1. From the pop-up window, select or search for your PathFactory track. Your PathFactory track should be fully QA'd and finalized before using in a Terminus campaign.

Notifications

Select the type and frequency of system notifications from Terminus Email Experiences. Daily emails are sent every morning. Weekly emails are sent every Monday morning.

- Engagement reports - Emailed daily or weekly and show who has recently clicked a campaign banner. To opt in/out of your individual engagement report email, visit the employee preference center.
- Install Reminders - Send reminders to all employees who have yet to install their Terminus email signature. These reminders will be sent automatically based on the selected frequency until the user has successfully installed their signature.
- Campaign Clicks - Send real-time notifications to employees anytime someone clicks their Terminus campaign banners. These notifications include the date, time, and contact who clicked on the Campaign banner. Employees can opt out of these notifications by editing their profile. This will automatically enable Campaign Click Notifications for new employees added to Terminus Email Experiences in the future.
- Campaign Click Notification Blocklist - Ignore clicks from some domains (for example, clicks from email security clients). Currently set up to ignore clicks in analytics from GitLab employees.

Privacy & Data

Export Data Archive

Create an archive of a recipient's data from Terminus. The archive will be emailed within 1-2 business days.

Delete Individual Recipient Data

Request to delete a specific email recipient's data. This will delete the click and views recipient data and records if they are on a list. A confirmation email will be sent within 1-2 business days.

Data Retention

Configure your account to clear out Terminus' store of recipient data on regular intervals. This will delete the clicks and views of all affected recipients.

Verify

Using Verify, you can troubleshoot the timing and personalization of Terminus campaigns.

1. Click the account avatar in the bottom right-hand corner and choose Verify.
1. Input the Sender, Recipient, and Date of Send to preview the matching campaign. For Sender, select a group or specific email address. For Recipient, select a recipient list or specific email address. Please note that the Recipient section only pertains to Targeted and Internal Campaigns while the Date of Send only pertains to Scheduled Campaigns.
1. The Results section details why the campaign was chosen.

Best practices

1. Campaign design guidelines

- 1. Campaign use cases
- 1. Campaign best practices
- 1. GIF best practices
- 1. Internal use cases
- 1. Signature design guidelines
- 1. Signature best practices

Banner ad image dimensions

The image will be constrained to half the size to ensure high density of pixels. Use the same banner ad size for all campaigns.

- 900 wide x 240 pixels tall
- 8px radius corners
- .png or .gif

Signatures

Resources

- 1. Signature management

Default fields

- 1. First name
- 1. Last name
- 1. Job title
- 1. Schedule a meeting URL
- 1. Mobile phone
- 1. Company URL
- 1. GitLab, Inc. physical address

Campaigns

Campaigns created in Terminus Email Experiences should align to GTM motions and our current marketing plan. Anything outside of the plan including ad hoc campaigns or activities will need prior approval to ensure there are proper resources to support.

Resources

- 1. Campaign management

Use cases

Content

- 1. Whitepapers and eBooks
- 1. Events & conferences
- 1. Case studies
- 1. Product Releases

1. Promotional video & teaser

Targeted

- 1. Region
- 1. Customer status
- 1. Persona
- 1. Industry
- 1. Past engagement
- 1. Opportunity stage

Types

- 1. Default - Display a banner ad as a fallback if no other rules apply
- 1. Sender - Assign banner ads to one or more employee groups
- 1. Targeted - Target banner ads to lists of contacts or accounts
- 1. Internal - Promote internal initiatives and content to GitLab employees
- 1. A/B test - Test two different banner ads to determine a leading variant
- 1. Alternate - Provide employees with a banner ad they can substitute on compose
- 1. Shuffle - Promote up to five banner ads each with their own unique URLs

Create a campaign

Before creating a Terminus email campaign, you need to request a banner ad from the brand and design team. All Terminus email banner ads should use the same dimensions (900 wide x 240 pixels tall; 8px radius corners) and be delivered in a .png or .gif format.

- 1. Select Campaigns from the side menu (flag icon).
- 1. Click the Create Campaign button in the top right.
- 1. Select your desired campaign type, name your campaign, and click Get Started. You are redirected to edit the campaign details.
- 1. Name your banner ad, enter alt text for the image, and upload the banner ad. All banner ads uploaded to Sigstr must have consistent dimensions to all other banners in our instance for consistency of output. Please follow best practices.
- 1. Under Clickthrough URL, choose your desired link type (manual clickthrough URL, mailto, or PathFactory experience). Note that you must already have a finalized PathFactory URL before selecting PathFactory Experience.
- 1. Select the UTM Parameters drop down to add additional parameters for your campaign. If you do not enter additional parameters, the default parameters will be applied:
source=emailsignature&medium=terminus&content=employeeemail Note that your campaign name becomes the default parameter for campaign. You also have the option of adding custom UTM parameters if desired. It is highly recommended that you apply UTM parameters to your campaigns to properly report success.

Review and activate a campaign

- 1. On the left side of the campaign edit page, click Review. You can also select the Next button to accomplish this same action.
- 1. Verify the look of your campaign. Ensure that the banner image does not appear blurry. If it appears blurry, try reuploading the banner image. If you still experience issues, please create

an issue in the marketing operations project.

1. Confirm the banner ad properties including the name, alt text, and clickthrough URL. Please test the URL to ensure it's working and that it leads to your desired location.

1. Choose your desired schedule for this campaign from the Schedule pane. You can choose to start the campaign immediately or at a later date/time. You can also set your campaign end date/time or let it run indefinitely.

1. If there is anything missing from your campaign, Terminus will show you in the Activate pane below Verify pane. Before you can activate a campaign, you must enter all required campaign attributes (banner ad, clickthrough URL).

1. Once finalized, click Activate this Campaign. You can also choose Save Campaign & Exit to save the campaign as a draft and activate at a later date.

SECTION: marketing/marketing-operations/traction-lead-complete.md

- Overview
- Lead Routing Workflow
- Partner lead management
- Contact routing workflow
- Account routing workflow
- Lead routing request or question?
- Traction Lead Flow update process

Overview

Traction Lead Complete is an application within Salesforce to process and assign lead records, as well as matching those leads to accounts.

Traction assigns each MQL (Marketing Qualified Lead) to the member of the Sales Development organization who is responsible for engagement and qualification of that individual dependant on the workflow. Currently we are only using Traction for lead routing.

Lead Routing Workflow

To read in more detail how our lead routing logic is set up, please visit the internal handbook page on Traction.

Partner Lead Assignment

In the first stage of the main lead assignment flow, Traction runs through its assignment rules to filter for Channel Partner and Distributor leads. They are assigned using campaign member based routing and primarily fields on the campaign member object. Most Channel related records are assigned to Partner Queue and passed to the Channel Partners via Vartopia Prospect module, where they can accept, assign and qualify the leads. If you are having problems with syncing partner leads to Vartopia, review the Vartopia sync requirements.

Note: Alliance partner leads will be assigned to members of the Sales Development team for qualification.

GitLab collaborates with Channel Partners to develop co-marketing campaigns including Partner sponsored, MDF funded, free trial and joint partner campaigns.

Partner Sponsored Event

GitLab allows Channel Partners to sponsor our owned events. Traction completes the following steps when it recognizes a new campaign member is associated with a partner sponsored event:

1. Reviews the lead fields for Lead Acquisition Source = Partner Sponsored Event and Vartopia Partner Account is not empty
1. Checks the lead fields for [Vartopia] Recalled Date is empty and Partner Recalled equals False
1. Updates Prospect Share Status = Sending to Partner and Partner Prospect Status = Qualifying which enables the lead to be synced into the Vartopia Prospect module
1. Assigns the lead to Partner Queue.

MDF Campaign

Traction completes the following steps when it recognizes a new campaign member is associated with a MDF campaign:

1. Reviews the campaign field for Will there be MDF funding = Yes and lead field for Vartopia Partner Account is not empty.
1. Checks the lead fields for [Vartopia] Recalled Date is empty and Partner Recalled equals False
1. Updates Prospect Share Status = Sending to Partner and Partner Prospect Status = Qualifying which enables the lead to be synced into the Vartopia Prospect module
1. Assigns the lead to Partner Queue.

Free Trial Campaign

Traction completes the following steps when it recognizes a new campaign member is associated with a free trial campaign:

1. Reviews the campaign name if it starts with Partner - Trial and the lead field for Vartopia Partner Account is not empty.
1. Checks the lead fields for [Vartopia] Recalled Date is empty and Partner Recalled equals False
1. Updates Prospect Share Status = Sending to Partner and Partner Prospect Status = Qualifying which enables the lead to be synced into the Vartopia Prospect module
1. Assigns the lead to Partner Queue.

Joint Partner Campaign

Traction completes the following steps when it recognizes a new campaign member is associated with a joint partner campaign:

1. Reviews the campaign fields for Is a Channel Partner Involved? = Yes and Campaign Member Status with regards to partner engagement, and the lead field for Vartopia Partner Account is not empty.

1. Verifies the campaign member is not actively worked by GitLab, thus Person Status is not Accepted, Qualifying nor Qualified, or Actively Being Sequenced = False.

If all above is

1. True, then Traction updates the Partner Prospect Status to Qualifying, Prospect Share Status = Sending to Partner, then assigns the lead to Partner Queue

1. False, then Traction assigns to appropriate SDR.

Exceptions to This Rule

When a lead/contact engages with GitLab in any shape or form, for example, via an inbound marketing request, the lead/contact owner is responsible for following up with the partner lead, regardless of their stage within the partner lead lifecycle.

Contact Routing

The scope of the contact assignment flow is very limited. Records are only processed by the lead assignment flow if they are meant to be managed by partners via the Vartopia Prospect module.

All other SFDC contact ownership rules are maintained outside of Traction. If you have questions or concerns about contact routing outside of partner record management processes, please reach out to Sales Systems.

Account Routing

All account routing is handled by Enterprise Territory Management (ETM). If you wish to learn more about this, please visit the sales operation handbook.

Traction Complete view on the account object

We have customized the lead section of the Traction Complete view on the account object. To navigate to this section in Salesforce Lightning, click Traction Complete on the top of the account page (same row you find Details). This will open the view where you can see all leads matched to the account with useful information like Full Name, Title, Email, Last Activity, Last Flow Name, and Active Flows Count. This information can be valuable to Sales Development and Sales to collaborate on reaching out to high value leads associated with their accounts.

Lead routing request or question?

Request an SDR alignment update

New hire? Territory change needed? Have an SDR on your team who's going to be out of the office? If requesting a proactive update to the lead routing workflow, open an issue using the LeanData change request issue template.

Experiencing a lead routing problem?

Lead volume low? Receiving leads from an account or territory you're not assigned to? If you think you've found a bug :bug: in existing lead routing logic, open an issue using the bug request issue template.

General questions

Open a Marketing Operations issue following the format in the issue template.

Traction Lead Flow Update Process

- For any updates in logic needed, we will first build the logic in the Staging SFDC environment, test appropriately and then upload the new graph to production.
- To make sure you are working off the latest flow, please export the live graph from production and import it into staging before making your edits. .

SECTION: marketing/marketing-operations/typeform.md

About Typeform

Typeform makes collecting and sharing information comfortable and conversational. It's a web based platform you can use to create anything from surveys to apps, without needing to write a single line of code.

Access

We have 2 licenses that we can provision on an as-needed basis. In order to request access, please open an access request. When you open the access request, please specify the timeframe for which you will require access. This will help us efficiently manage the licenses and the needs of the team.

Monthly Response Limits

We are on Typeform's Plus plan, which has a limit of 1,000 responses per month. A response is counted when someone submits our typeform. Response limits apply across all forms in your account - we have a total limit of 1,000 responses across our account, not 1,000 responses per form. We'll receive an email when we reach 90% and 100% of our response limit. We can adjust how many responses our plan includes whenever we need. Adding on additional responses costs \$100 per 500 responses. We'll stay on the higher response tier once additional responses are added on to our account. Unused responses do not carry over to the next month. Deleting responses won't add them back to the number of remaining responses for the month. If you delete a response, you will no longer be able to access the content of that response, but the response will still count towards your limit for that month.

Creating a Typeform for use on about.gitlab.com

Once you've created your Typeform and ready to create a landing page on the marketing website, it's time to generate your embed code.

When you're creating your embed code, make sure to choose the "standard" size. Using other sizes will result in the Typeform not displaying correctly in the template we have designated for Typeform landing pages.

Resources

- How to build a Typeform
- How to generate a Typeform embed code
- Typeform landing pages with Netlify CMS

Data Deletion Process

In order to maintain compliance and reduce risk, survey data will be stored in Typeform for 12 months. After 12 months, survey data will be moved to this Google Drive folder. Survey data will be audited and moved to the Google drive folder quarterly.

SECTION: marketing/marketing-operations/usergems.md

Ways to access UserGems data

UserGems data lives inside SFDC, all users are able to visualize it on the lead and contact objects as well as on the custom UserGems object. To view the UserGems Leads go to the App Launcher in Salesforce Lightning and select UserGems. Once there, you'll be able to reference List Views for All UserGems / My UserGems.

You can know if a lead is created by UserGems by referencing it's Initial Source. UserGems creates leads with two slightly different initial sources based on the two ways of tracking: Contact Tracking / Target Account Tracking.

The two initial sources you'll see on UserGems created leads are the following:

- UserGems Contact Tracking
- UserGems - New Hires & Promotions

UserGems Contact Tracking

UserGems helps GitLab track up to 50K matched contacts from different, carefully selected cohorts, as follows:

- CW Opp Associated Contacts (Large);
- CW Opp Associated Contacts (Mid-Market);
- CW Opp Associated Contacts (PubSec);
- CW Opp Contacts (SMB, by Titles);
- Contacts associated with Open Opp (Large);
- Contacts associated with Open Opp (Mid-Market);
- Contacts associated with Open Opp (PubSec).

UserGems Target Account Tracking

In a separate motion to the contact tracking, UserGems also helps GitLab identify New Hires & Promotions into our target accounts.

The current list of target accounts UserGems is tracking for GitLab can be viewed using this Salesforce Report.

What happens when UserGems detects a job change?

When job changes (or new hires/promotions into the target accounts) are detected for the contact cohorts tracked above, UserGems will:

- create a net new lead with the recent account/company info;
- mark the existing contact as No Longer at Company using the UG - No Longer at Company checkbox field;
- update the status to Disqualified
- set the Disqualified Reasons to No Longer at Company.

UserGems Contact Tracking New Lead Creation Frequency

UserGems splits the 50K contacts tracked into two tier buckets:

- Tier 1 Contacts (1,000 contact records) from the top cohort (CW Opp Associated Contacts withing Large Segment) - The job changes for these contacts are tracked and if detected, net new leads are created in our SFDC on a weekly basis on Tuesdays.
- Tier 2 Contacts (49,000 contact records) from the remaining contact records listed in the UserGems Contact Tracking section. The job changes for these contacts are tracked and, if detected, net new leads are created in our SFDC on a monthly basis on Tuesdays.

UserGems Available Fields

Either through reporting or on the lead/contact/UserGems objects, you'll be able to reference a few fields that will be populated by UserGems. Some of the most important ones are:

- [UG] Company Country; - As the field name says, this represents the current company country;
- [UG] Person Country; - As the field name says, this represents the current person country;
- [UG] Company State; - As the field name says, this represents the current company state;
- [UG] Person State; - As the field name says, this represents the current person state;
- [UG] Person LinkedIn URL; - This is the current LinkedIn URL of the individual;
- [UG] - Is Target Company; - This checkbox will be checked if the account is found in the list of target accounts tracked by UG;
- [UG] - No Longer At Company; - This checkbox will be checked on the contact object if UserGems identifies a job change for the respective contact;
- UG - Is Customer Company; - This checkbox will be checked if the account is found on the list of customer accounts shared with UG;
- UG - Job Started Date; - This field will be updated on the lead record and will contain the job started date;
- UG - Past Account; - This field will be updated on the net new leads created by UG and will link to the account found on the associated contact;
- UG - Past Contact; - This field will be updated on the net new leads created by UG and will link to the previous contact for which the job change was identified;
- UG - Past Title; - This field will be updated on the net new leads created by UG with the title the contact had prior to the job change;

UserGems Meeting Assistant

UserGems Meeting Assistant is a separate stand alone feature of UG that syncs to SDRs/BDRs Google Calendars and captures & enriches the third party contact data present in their meetings. If this contact data meets all necessary criteria, it is added as a contact in our SFDC instance.

The necessary criteria that needs to be met for a contact to be created in SFDC is the following:

- associated account/company exists in our SFDC environment;
- associated account/company matches our set persona;
- contact has a linkedin profile;
- contact's email domain does not match the "free email providers";

Separately, if an open opportunity also exists for the contact's company, the contact will also be added as a contact role to that open opportunity.

We're starting to leverage Meeting Assistant as a pilot for a group of 6 reps on the 12th of December. With the plan to do a full roll-out to the whole Sales Development org in mid to late January 2025.

The tool is only processing the data of third-parties and data subject rights do not impute from that third-party contact to the Team Member. Even in the case where a team member uses a work calendar to schedule a meeting with friends, that contact will be omitted due to a personal domain exclusion.

Lead Routing & Notifications

Traction Complete will be used to route the leads created by UserGems as well as for notifying the BDRs/SDRs/AEs using either email or slack or both. The notification will run weekly (on Wednesdays) a day after UserGems data syncs to Salesforce (Tuesdays). We are using scheduled flow to trigger the notifications:

- 1 A/B/C/D Notifications will trigger when: LeadSource = 'UserGems Contact Tracking' AND CreatedDate = YESTERDAY
- 3 A/B Notifications will trigger when: UserGemNoLongerAtCompany = true AND Status = 'Disqualified' AND UnqualifiedReasons = 'No Longer At Company' AND UnqualifiedDateTime = YESTERDAY

Do keep in mind that the notifications will be turned off for the retro-active leads due to the high volume of these leads, notifications will be turned back on after the first initial batch is completed.

UserGems leads will be marked as high priority with a high priority reason of UserGems Lead, which allows leads to be assigned at creation. Leads that are SMB and have no BDR assigned on a matched account will round robin to SDRs, while the remaining will be assigned to BDRs.

Dynamic Layouts

On both the lead & contact object, on the top right side, if this is a UserGems Lead or a UserGems Past Contact, you'll be able to reference, at a glance relevant information like: Current Lead Link, Past Contact Link, Current Account, Current Account Type, Current Title, Current Email along with many other fields that are relevant.

Sales Enablement

A training for SDRs/BDRs took place on 09/19/2024 and the recording can be viewed [here](#). For any questions regarding UserGems feel free to reach out to either Marketing Operations or Sales Development.

Sales Dev Plays

To get more information regarding the different plays for the UserGems created leads, please visit the Sales Development Handbook UserGems entry.

SECTION: marketing/marketing-operations/vartopia.md

Vartopia Overview

Vartopia is a partner lead sharing and deal registration system designed to maximize the value of GitLab partner program for channel partners. Vartopia offers multiple module including Prospects, Deal Registration, Account Mapping and Campaign. Partner lead sharing is part of the Prospects module, while deal registration is part of the New Registration and Registrations module. Watch this video for step-by-step instructions on where partners can view, accept, reject, assign and convert leads to deal registration.

Prospects Module

Channel Partner Lead Flow Overview

Channel Partners can work with the Channel Marketing team to create campaigns that will be shared to the Vartopia Prospects module. The campaign types include Partner sponsored, MDF funded and joint partner campaign.

The flow starts from Marketo > Salesforce > Traction > Vartopia.

The partner lead is:

1. Created in Marketo via list import or form submission
2. Synced SFDC via Salesforce Campaign Sync
3. Assigned to Partner Queue via Traction
4. Added to the Prospects Module in Vartopia.

Vartopia Sync Requirements

In order for the Partner to be able to see and action the lead in Vartopia, the SFDC record must have the following fields updated. Vartopia calls SFDC every hour looking for updates to the SFDC record.

1. Vartopia Partner Account not equal to NULL (set by Marketo)
1. Prospect Share Status = Sending to Partner (set by Traction)
1. Partner Prospect Status = Qualifying (set by Traction)

Once synced successfully between systems, the Vartopia Transaction Id in SFDC will update from Vartopia. If this ID is missing, the lead did not sync correctly.

Vartopia Access

The account in SFDC must be set to Vartopia Partner Account: Vartopia Access = Yes in order to be passed leads. If that field is marked false, a SFDC error will occur when Vartopia Partner Account tries to be set. If this error occurs, the lead will not sync from marketo to SFDC, or if they are already existing in SFDC, that field will not be populated.

Troubleshooting Vartopia Sync

When the Prospect Share Status shows as Sending to Partner and the Vartopia Transaction ID isn't populated after a day, this typically means there is a sync error between Vartopia and Salesforce.

Here are the steps to resolve the sync fail.

1. Vartopia Partner Account must be referring to an account with a Vartopia System ID
2. Vartopia Partner Account associated with the partner requires a Prospect Admin
3. The partner lead requires a phone number and email address
4. Prospect Partner Status on the partner lead must equal Qualifying
5. Vartopia Deal Registration System Access on the account must be Active.

If all these are submitted correctly, then submit a Vartopia support ticket with a list of the failed sync and its Vartopia Prospect Id. The Vartopia Prospect Id (ex. L-555555) is a unique lead number identified populated by SFDC that shows in Vartopia and SFDC. We can use this as a non-PII identifier in both systems.

Prospects to Deal Registration

We can link the Prospect to the DR so long as it's in Prospect Share Status = Accepted, and there is either a matching domain and/or an exact match on the email address. Partners will be prompted with a pop-up to link the Prospect upon DR creation. When the DR is created, Partner Prospect Status will automatically be updated to Converted to DR.

See how this works.

Notifications

The Partner Prospect Admin will receive an email notification when leads are shared them via Vartopia. Vartopia does not offer the functionality to send alerts, thus the main workflows are built and sent from Marketo:

- List Import

Assign to Partner Button Workaround

Vartopia has a validation rule that requires manufacturers to use the Assign to Partner button and manually assign the lead to Partners.

To bypass this validation rule, we need to uncheck or check the Update from Vartopia when updating the Share and Prospect Status. However, we don't want to update a status when Update from Vartopia is TRUE, since this would mean the lead was already assigned to another partner.

Prospects Module for Carahsoft

We allow Carahsoft access to the Prospects module through the Partner Placeholder Pubsec partner account, which will allow them to receive leads from joint GitLab - Partner marketing campaigns.

To access the Prospect module, Carahsoft will log into the Partner Placeholder PubSec profile from Impartner, then SSO into Vartopia. The access to the Prospects module is limited to only Marketing users. Should the Sales users wish to create a Deal Registration, they will have to create the deal through their log in to the Distributor account.

In short, only Marketing will use the Prospects through the Partner Placeholder Pubsec, and Sales will continue to create deal registration through the Distributor profile for Carahsoft.

Internal Process

1. Account - Add marketing email alias to the Prospect Admin
2. Campaign/Marketo Setup Process will remain the same in Allocadia, Salesforce, and Marketo.
3. Attribution - add campaign to smartsheet so it's displayed in the Distributor Marketing Campaign dropdown.
4. List Import/UTM - when importing the list the CRM Partner ID needs to be assigned to Partner Placeholder PubSec (Account ID (18) = 0014M00001sDPJWQA4)

External Process for Carahsoft

1. Log into the Partner Portal using marketing email alias
2. Access Vartopia via Deal tabs
3. Click on Prospects to receive shared leads
4. Bulk accepts leads so they can be links from Prospect to DR, when DR is created.

Partner Recall

The first phase of the recall process is live in the "Prospects" module in the GitLab Partner Portal. The recall process is built to be able to pull back leads that are not being actioned.

Only partner leads acquired from fully paid initiatives generated by GitLab Inc. through joint campaigns are subject to recall. We will not recall leads from Partner sponsored, and MDF funded campaigns.

As part of the first of three phases, partner leads older than 30 days with a Prospect Share Status = Pending implying the Channel Partner has not accepted nor rejected the lead, will be recalled.

In the final phase, GitLab Inc. will allow Channel Partners a period of 5 days, starting from the day the lead is assigned in the Prospect module, to accept the lead by updating the Prospect Share Status. After accepting, Channel Partners will have a period of 10 days starting from the date the lead was accepted to revise the Partner Prospect Status before the lead is re-routed back to GitLab Inc for follow up.

Recall Process Overview

- [· NOW LIVE] Phase 1 - recall leads created over 30 days ago (not accepted nor qualified)
- Phase 2 - recall leads that have not been accepted after 15 days (not accepted nor qualified)
- Phase 3 - recall leads accepted after 5 days, and not actions (not qualified) after 10 days.

Reminder: This only applies to leads acquired from joint campaigns.

Rules

- At any time, a recalled lead participates in another partner campaign, they will not be reassigned to a partner.
- At any time, a partner lead participates in multiple campaigns will be prioritized to the partner of the first campaign.
- At any time, a lead participates in an MDF campaign, they will not and can not be recalled.
- Actively working leads will not shared to partners which means their CRM Partner ID can not be updated or should be removed. The only exception to this rule are leads who participate in an MDF campaign.

FAQ - Partner Recall

<details><summary>What is Vartopia and how does it fit in the Channel Partner Lead Flow?
</summary>

Vartopia is a lead-sharing module that allows the marketing team to share leads with Channel Partners. This platform is being actively used throughout multiple initiatives including Partner sponsored, MDF funded and joint partner campaign. When a partner lead is passed to a Channel Partner, the leads will become visible in Vartopia where the partner can choose to accept and action the lead or reject.

Note, Channel Partners do not know what Vartopia is, they can access Vartopia, as Prospects in Impartner Partner Portal.

</details>

<details><summary>Why is this important to CAMs? Why do I need to work with the Channel Partner to see this through?</summary>

As a CAM, you should be aware of the joint-marketing campaigns that the Channel Partners are involved in to drive channel pipeline. These campaigns are ran and funded by the Field Marketing team, and leads acquired from are subject to recall. CAMs need to work with Channel Partner to ensure they update their leads' Prospect Share Status to Accepted otherwise the Channel Partner will lose their leads.

</details>

<details><summary>What's the purpose of the recall process?</summary>

The recall process allows for GitLab Inc. to pull back leads from joint campaigns that aren't actioned by Channel Partners. This will also encourage Channel Partners to work on the leads as they come in. Only partner leads acquired from fully paid initiatives generated by GitLab Inc. through joint campaigns are subject to recall. We will not recall leads from Partner sponsored and MDF funded campaigns.

</details>

<details><summary>Who does the partner recall process affect impact?</summary>

The partner recall process affect Channel Partners as their leads will be removed from Vartopia, more specifically resellers who participate in joint-marketing campaign with GitLab Inc. This should not be a surprise to Channel Partners as this process is mentioned in their SLAs. Remind your Channel Partner to review their leads and update their Prospect Share Status

should they wish to keep the leads in their own possession.

</details>

<details><summary>How do you know when a lead has been recalled?</summary>

A partner lead is recalled when their Prospect Share Status = Recall. After the lead is removed from Vartopia, Prospect Share Status will equal to NULL, [Vartopia] Recall Date will be populated with a date/time, Partner Recalled = True.

</details>

<details><summary>What resources are available to track the leads that are recalled?</summary>

This google sheet contains the records recalled from partner, and recalled records in Actively Working Accounts:

- Partner Recall Records

</details>

<details><summary>What will happen when the leads get recalled?</summary>

The lead will be assigned to the Recycle Queue, enrolled in the nurture and their status will be changed to Recycle.

</details>

<details><summary>When will the other phases be launched?</summary>

There is presently no firm date on the other phases. We are open to feedback on changes to improve this recall process.

</details>

SFDC Lead/Contact Page Layout

To retrieve information on a specific lead or contact, you can review the Partner Lead Sharing Information in Salesforce where the Vartopia Partner Account, Prospect Share Status, Partner Prospect Status and more can be found.

Scheduled Reports

Creating scheduled reports that sends to channel partners' inbox at the start of the week is the best way to stay on top of leads.

Follow the steps to create a report that summarizes new leads that are assigned to Partner Prospect Admin.

1. Log into Partner Portal
1. Go to the "Sales" tab
1. Click the orange button "Register Opportunities"
1. Go "Prospects" view, find "Custom Reports" located on the top right and click "New".
1. Create New Customer Report

1. Update Report Name
1. Update Advanced Filtering
 1. Share Status Filter
 1. Status Filter
 1. Update Assigned User
 1. Update the Selected Columns
1. Update Date Filter
 1. Update Created Within (Number of days)
1. Update Scheduling and Distribution
 1. Frequency
 1. Day of Week
 1. Update the Distribution List
1. Click "Save Report"

Campaign Module

The Campaign module is an independent module from Prospects. The purpose of this module is to be able to link campaigns to deal registration and track and measure the effectiveness of partner campaigns.

Upon deal registration creation, when Vartopia recognizes that a lead is matched to a campaign, a field called GitLab Marketing Campaign will be prompted and the partner must select the campaign that influenced that deal registration.

Campaign will be synced to Vartopia starting September 27, 2023 (module launch date) and they will be removed after 6 quarters.

Process

1. Allocadia - select the Channel Partner Name in the campaign detail panel
2. Marketo - input the subcategory ID into the Marketo program description.
3. Marketo - sync the program to the SFDC campaign.
4. Salesforce - create SFDC campaign with Sync to Vartopia and Partner Account (automated). Partner Account will pull from Channel Partner Name, so Channel Partner Name needs to be an exact match to the Partner Account for the automation to work.
5. Vartopia - when a lead is ready to convert to DR, Vartopia will recognize there's a campaign linked to the account, and display a dropdown to select the campaign name.
6. Salesforce - see the deal registration that's created and update the metrics on the campaign.

Vartopia Sync Requirements for Campaign Module

- The Partner Account must be selected with a Channel Partner to sync to Vartopia.
- Sync to Vartopia must be checked on the campaign.
- Campaign must be active to sync.
- Only one Partner Account can be selected per campaign. For campaigns with multiple partners, you are required to create a child campaign per partner.

Create a new Salesforce Campaign to Sync to Vartopia

You can create a new campaigns to sync to Vartopia, to do so, you'll want to follow these steps.

1. Log into Salesforce
1. Go to Campaigns tab
 1. If you aren't seeing the Campaigns, select the + to see all tabs, and click on Campaigns
1. Click on the New button to create a new campaign
1. Add Campaign Name (required field), you'll want to follow a similar naming convention (YYYYMMDDPartnerNameRegionCampaignTypeActivityName) to marketing campaigns. For some examples:
 1. 20221005Trace3EvolveLasVegasIn-Person
 1. 20231101PresidioL&LVirtual
 1. 20230306MDF159ComputacenterCSDCWestMeeting
1. Check Active
1. Select Type and Type Details
 1. Add any related issue(s) or epic(s) in Event Epic
1. Update the Status appropriately
1. Add Start Date and End Date
1. Update Region and Sub-region
1. Update Budgeted Cost in Campaign (required field)
1. Under Vartopia Partner Information, select Partner Account and check Sync to Vartopia
1. Save.

Add GitLab Marketing Campaign on the DR Form

There are two path that partners can access the GitLab Marketing Campaign field, through the Prospects or New Registration tab. See slides for more instructional details.

Through the Prospects tab:

1. Retrieve the lead from the Prospects tab
1. In the Prospect details, Partners will be able to see the campaign history on the Web Form field.
1. Update Prospect Share Status to Accepted
1. Change Partner Prospect Status to Qualified to unlock the Convert to Deal Registration button
1. Fill out the first step of Deal Registration form
1. In the second step of the form, select the GitLab marketing campaign that drove the deal reg.
 1. GitLab Marketing Campaign is a required field
 1. The best practice is to select the marketing campaign.
 1. But, If the deal reg was not influenced by a marketing campaign, select Not Applicable.

Through the New Registration tab:

1. Create a new deal registration if POP has not be sent to GitLab
1. Fill out the first step of Deal Registration form by adding a new company and contact.
1. In the second step of the form, select the GitLab marketing campaign that drove the deal reg.
 1. GitLab Marketing Campaign is a required field
 1. The best practice is to select the marketing campaign.

1. But, If the deal reg was not influenced by a marketing campaign, select Not Applicable.

Deal Registration Change Request

In the scenario where the GitLab Marketing Campaign needs to be added, updated or removed, the marketing team will need to create a Marketing Ops issue using the `pntrdrcampaignrequest` template.

The following will be required in this change request:

1. Identify the DR(s) that need to be updated with proof of campaign member or touchpoint
2. Marketing Ops will verify DR(s)
3. Partner Marketing team Approval
4. Marketing Ops to add GitLab Marketing Campaign

Note, that only Campaign after September 27 (launch date) will be approved.

This is a video recording should you need a visual capture of how to create the change request.

Use Case for Distributors

Distributors are responsible for managing and overseeing campaigns, and assigning and sharing the acquired leads with Channel Partners. The Channel Partner will then be obligated for following up, actioning, and creating the deal registration. With the Campaign module, partners can finally link their deal registrations to the Distributor's MDF campaigns.

EMEA and APAC Distributors - Process

In comparison to the main process, we are required to create a child campaign per partner and this is highlighted in step 5.

1. Allocadia - select the Channel Partner Name (distributor) in the campaign detail panel.
2. Marketo - input the subcategory ID into the Marketo program description.
3. Marketo - sync the program to the SFDC campaign.
4. Salesforce - create SFDC campaign (automated).
5. Salesforce - create a child campaign and set the SFDC campaign as your parent campaign.
6. Salesforce - update the Partner Account (partner) on the child campaign.
7. Marketo - import the leads from POP to the child campaign - leads must already be assigned to partners on import.
8. Vartopia - when a partner converts the lead to DR, Vartopia will recognize there's a campaign linked to the account, and display a dropdown to select the campaign name.
9. Salesforce - see the deal registration that's created and update the metrics on the campaign.

Carahsoft

Distributor Marketing Campaign

On the second page of the DR form, we will have a new campaign field called: Distributor Marketing Campaign dropdown when the Distributor Account is selected. The campaigns are

collected via a smartsheet which Gabby will be responsible for keeping up to date. When a new entry is submitted to the smartsheet, Vartopia is responsible for adding that campaign to the Distributor Marketing Campaign dropdown.

Then, they will no longer need to use the GitLab Marketing Campaign on the deal registration form.

This will allow the Distributor to tie the DR to the campaign, HOWEVER, we'll still need to use the Partner Placeholder Pubsec reseller account.

This process is still a work in progress, follow along in this epic for the next iteration.

Field Glossary

Lead Object

Partner Prospect Admin

The Partner Prospect Admin is a role that is responsible for managing and assigning the Prospects. Each Vartopia Partner Account can only have one person that will fill this role.

This SFDC field in the Vartopia Partner Account MUST be filled in or else the records will be passed to no one.

Prospect Share Status

The Prospect Share Status governs the sharing of the lead and the receipt of the lead by the partner. The prospect share status has statuses that are set by both the manufacturer and the partner. Partners see this field as Sharing Status.

1. Sending to Partner: This is the initial status set when sharing a lead to a partner. This status is set by GitLab.

1. Pending: This is an automated status, set when the lead is synced to the partner facing system. As part of the sync flow, the system sets the status to pending in both the partner facing system and SFDC. It is visible to both the reseller and the MFG.

a. Meaning in SFDC: Pending indicates to the MFG that the lead has been successfully shared.

b. Meaning in partner facing system: Pending indicates to the reseller they have a new lead shared from the MFG that they now need to accept or reject.

1. Accepted: Indicates the reseller has accepted the lead and intends to work the opportunity. This status is automatically updated in SFDC.

1. Rejected: Indicates the reseller has refused the lead. This status is automatically updated in SFDC.

a. Note: rejecting a prospect immediately removes the prospect from the resellers' system. They no longer have any visibility to the prospect. The sync ID is cleared from the prospect record in SFDC, and the record is ready to be assigned to a new reseller. The prospect will be in Rejected and Qualifying Status. A new partner can be selected, and the Share Status set ba
