

advanced objection handling techniques and introduce influence and persuasion.

>

> 3 credit hours

300s -

TT300: Advanced Sales Conversations

> Learn some of our customers' biggest technical initiatives and how to use them within our sales conversations (cloud migrations, automation, infrastructure as code, and microservices). Also covers the difference between product selling and solution selling.

>

> 3 credit hours

TT301: Security as a Differentiator

> Security is our biggest differentiator with our competitors. This class goes over how to leverage this differentiator in our sales conversations.

>

> 3 credit hours

TT305: AWS and Google Alliances (deprecated)

> In this class, we will learn about what alliances are and discuss our co-sell motions with Amazon and Google. Great for those that are planning on working AWS/Google events.

>

> 3 credit hours

TT310: Demoing GitLab

> In this class, we will practice demoing GitLab. After taking this class, you will be able to perform brief customer demos to gather customer interest and explain product value.

>

> 5 credit hours

TT330: Career Builder

> In this class, we will discuss best practices for plotting your career direction and how to get there. Included in this class is "Sales Stories," where we interview sales leaders to help you determine which path to take your career.

>

> 5 credit hours

TT331: Alumni Stories

> In this class, we interview some of our most esteemed alumni about their times here in sales development, including lessons learned. Those interviewed include Lisa Van de Kooji, Brandon Greenwell and Da'Neil Olsen.

>

> 3 credit hours

TT332: Leadership Perspectives

> This is a class where we will have rotating speakers speak on different leadership perspectives. We will specifically introduce topic such as strategic leadership, organizational leadership, and people leadership. This class is great for those considering team lead or management positions.

>

> 3 credit hours

TT380: Technical Questions for Sales (deprecated)

> This is a class offered by the sales enablement organization equipping salespeople to answer the most commonly asked technical questions. You may see the curriculum [here](#). This class is delivered async only.

>

> 5 credit hours

TT381: The Sales Required 7 (deprecated)

> This is another class offered by the sales enablement organization and covers Ryan O'Neil's required seven sales process. Recommended for those considering applying to the commercial sales organization.

>

> 5 credit hours

Role-Based Classes -

Inbound:

> Covers inbound workflow best practices (call, email, Drift), time management and note taking.

>

> 5 credit hours

Outbound:

> Covers the different modalities of outreach (call, email, LinkedIn), identifying focus accounts and personas, time management, note taking, and best practices for working with sales.

>

> 5 credit hours

Examination

We test for mastery (mastery-based learning) and students will be asked to demonstrate knowledge/skills learned. Students will be asked to repeat examination (or update answers) until mastery is demonstrated and the number of attempts needed is tracked.

To hand in written exams:

Make a copy of the exam template by clicking an exam link listed. For example see [here](#).

Rename the generated file appropriately using appropriate syntax. As an example this would be for Ed Bao: TT100 - Introduction to Technology (Ed Bao).

Change file ownership to Christopher Wang and allow some time for grading (one week on average).

Note: if your assignment hasn't been graded for over three weeks, we likely made a mistake. Let us know and we'll fix the issue.

Enrollment

Coursework will be assigned at the beginning of each quarter. To see your assigned coursework, see [here](#).

To complete coursework virtually, take classes at your own pace on Level Up.
Some sessions are offered live. Those that are offered live will be communicated to team members.

Onboarding

All team members are required to meet certain enablement milestones by the end of their first and third months. To see these requirements, see "Sales Development Leveling" below.

For links to the Tanuki Tech courses, see [here](#).

For the link to the onboarding checklist, see [here](#).

For the link to Inbound (SDR), see [here](#).

For the link to Outbound (BDR), see [here](#).

For Inbound (SDR) and Outbound (BDR), take the quiz at the end to pass.

Sales Development Leveling

To qualify for promotions, sales development team members are required to keep up with their quarterly enablement. The following are the current course requirements and are subject to change.

Tenure	SDR	BDR
-----	-----	-----
First month	TT100, TT101, TT102, TT103, TT104, TT110, onboarding checklist	TT100, TT101, TT102, TT103, TT104, TT110, onboarding checklist
Third month	TT105, Getting Started for Sales Development, Sales Quick Starts	TT105, Getting Started for Business Development, Sales Quick Starts
Second quarter	TT120, TT201, TT210, TT211, TT251	TT120, TT201, TT210, TT211, TT251
Third quarter	TT200, TT220, TT252, TT300	TT200, TT220, TT252, TT300
Fourth quarter	Getting Started for Business Development, TT301, TT310, TT330	TT301, TT330

To see your current progress, see [here](#).

Tanuki Tech Faculty

Christopher Wang currently serves as the first dean of Tanuki Tech.

Ed Bao serves as a teaching assistant for Tanuki Tech.

SECTION: marketing/sales-plays/_index.md

Why Sales Plays

Sales plays are designed to improve the quantity of opportunities and closed business with defined Land and Expand sales motions to ultimately generate more ARR for GitLab. More specifically, codified sales plays help to ensure that the sales team is trained and capable of executing either (or both) of the following:

1. A repeatable set of proven successful sales tactics (Evergreen sales plays)
1. A generated set of steps in coordination with a particular time-bound campaign (Focused sales plays)

Sales Play Goals

Specific sales play goals may vary from quarter to quarter but may include (but are not necessarily limited to) the following:

- Increase the number of sales-generated First Order opportunities
- Improve win rates against a specific competitor
- Increase MQL to SAO conversion

What is a Sales Play

A prescribed, structured set of steps or activities that sellers (GitLab and/or GitLab partners) can execute, on their own, to build pipeline

Types of Sales Plays

Sales Play Type	Purpose	Timing	Duration	Number
Evergreen	General outbound prospecting & pipe gen	Criteria-driven (when you see x, do y)	In perpetuity until sales play no longer "works" (ongoing maintenance required)	Prioritized plays that are limited in number (10 or fewer)
Focused	Marketing and/or prospecting campaign-related; may use an evergreen play as a starting point	Time-bound and scheduled	Run and done (though play could be re-run at a future point in time)	No set number
Test	Prove out new motions based on new or emerging capabilities and/or markets	May be evergreen or focused	May be evergreen or focused	No set number

Sales Play Bill of Materials

Sales plays will include but are not necessarily limited to:

- Ideal customer profile and target personas
- Persona-based messaging
- Prospecting guides
 - What to know (common pains, positive business outcomes, required capabilities, key GitLab differentiators, and supporting proof points)
 - What to say (including recommended discovery questions, business value-based positioning points, how to overcome common objections, potential services to attach)
 - What to do (steps and tactics to execute the play including suggestions for how to leverage various partner types)
- Email and LinkedIn InMail templates (that Sales is encouraged to tailor as appropriate)
- Featured assets to share with customers and prospects
- Focused sales plays will also include target account and/or contact lists

Evergreen Sales Plays

Sales Play	Target Customer Segment(s)	Ideal Customer Profile	Target Personas
Upsell Premium to Ultimate	ENT and COM; Growth	existing Premium customers who are already taking advantage of GitLab CI/CD capabilities	Economic buyers and technical influencers
Infrastructure Automation (GitOps)	primarily ENT; First Order and Growth	organizations that want to increase the elasticity and scale of their IT infrastructure via a prescriptive workflow for using Infrastructure as Code	CIO or VP of IT; VP of IT Infrastructure; VP of Platform Engineering
BitBucket Sales Play	ENT and COM; First Order	organizations that currently use BitBucket Server, Cloud, or Data Center	CIO, with App Dev Exec/Director/Manager as champion
Expand with Package Management	primarily ENT; First Order and Growth	organizations that migrate off of JFrog's Artifactory or Sonatype's Nexus in order to reduce costs, improve developer experience, and be more efficient.	Economic buyers and technical influencers
Agile Planning (including competitive take-out)	TBD	organizations looking for better and/or more cost-effective ways to manage projects, programs, and portfolios using agile methodologies	VP of Application Development
Land with CI (including competitive take-out)	ENT and COM; First Order	organizations looking for better ways to increase the quality of their code while decreasing complexity and time to delivery	Application Development Manager or Director; Software Developer and Team Lead; DevOps Engineer
Land Ultimate (CD + DevSecOps)	ENT and COM; First Order	organizations looking for a comprehensive DevSecOps solution	CIO or VP of IT; CISO; IT Security Manager
GitHub Compete	ENT and COM; First Order and Growth	organizations looking to standardize on a comprehensive Value Stream Delivery Platform (VSDP)	Economic buyers and technical influencers
Source Code Management Competitive Take-out	ENT and COM; primarily First Order	organizations looking to migrate off legacy SCM solutions to a best-of-breed on-prem or SaaS SCM solution with ability to consolidate their DevSecOps toolchain	CIO or VP of IT; VP, Director, and Manager of Application Development
Security Take-out and/or Augmentation	primarily ENT; Growth	organizations that want to improve their application security posture	CIO or VP of IT; CISO; IT Security Manager
Digital Transformation / DevOps Platform	ENT and COM; First Order and Growth	organizations that want to accelerate the speed and improve the visibility of application development and delivery supporting broader digital transformation initiative(s)	Economic buyers and technical influencers
Cloud-Native & Application Modernization	ENT and COM; First Order and Growth	organizations that want to use more modern, cloud-native approaches to application development (e.g. containers, Kubernetes, serverless)	Economic buyers and technical influencers

SECTION: marketing/sales-plays/package.md

Note: Think of a sales play as a recipe. If you follow the recipe, we can achieve more predictable, consistent results. And if we find an asset or approach that works best (or flops), then we can tweak the recipe to continuously improve. If you have improvements to suggest, please contribute comments to this issue to suggest your edits and upvote on others.

Sales Play Quick Reference Guide

Sales Play Quick Reference Guide (internal)

Overview

Objective - Competitive take out of JFrog's Artifactory and Sonatype's Nexus.

Who is this sales play for?

Primary: SAEs and AEs who call on one or more existing GitLab Premium/Ultimate customers
Secondary: SAs and CSMs who support one or more existing GitLab Premium/Ultimate customers

Who to meet

Ideal Customer Profile - GitLab customers looking to consolidate on GitLab and migrate away from JFrog's Artifactory or Sonatype's Nexus.

Bonus points for:

- Organizations at lower maturity level undergoing or planning to undergo transformation
- Siloed teams with disparate tools for managing artifacts, such as packages or container images
- Organizations with stringent regulatory security or compliance requirements

Target Buyer Personas

Persona role	Possible titles
Economic buyers	CISO, VP of IT or CTO, App/Dev Director
Technical influencers	Chief Architect, App Dev Manager
Other Personas to consider	Infrastructure Engineering Director

Getting Started

Consider the following questions:

- What has prevented the customer from moving away from (or considering moving away from) JFrog's Artifactory?
- Does the customer have any strategic initiative or priority to which consolidating on GitLab and removing an additional tool/license?
- Are you engaged with the right personas/teams (see Target Buyer Personas above)?
- Do you have access to power/authority (a business decision maker)?
- Who are your champions within the account?
- Are the capabilities that are enabled by GitLab Package important to the customer? Why or why not? How do you know?

Value Discovery

Common Pains

GitLab Premium/Ultimate customers may be experiencing one or more of the below challenges:

Challenges ("Before Scenarios")	So What? ("Negative Consequences")
----- -----	
Managing complex tool chains, plugins, and fragile automation scripts	Added cost, maintenance, and admin overhead
Poor developer experience from switching apps and context	Inefficient use of scarce developer resources
Costly triaging and tracking of vulnerabilities	Inefficient use of scarce security resources, lengthy remediation process
Costs are unpredictable or concerning as DevSecOps scales	Must find more money as number of supported applications grows

Common Benefits

By consolidating on GitLab for package management, customers may experience one or more of the below benefits:

Desired Future State ("After Scenarios")	So What? ("Positive Business Outcomes")
----- -----	
Reduced cost, maintenance, and admin overhead	Save money on licensing costs
Greater efficiencies for security, admin, and dev	Less risk and greater velocity of DevSecOps
Reduced security exposure, more scanning finds more vulnerabilities	Reduced risk to finance and reputation

Required Capabilities

Market Requirement	Description
----- -----	
Publish, download, and validate packages	A private or public registry for a variety of common package managers.
Publish, download, and validate container images	A highly scalable application that stores and lets you distribute Docker images.
Reduce costs with cleanup policies	Dependencies can build up fast. You need a way to manage storage costs.
Use GitLab metadata to validate artifacts	Dependency metadata is required to validate you are using the correct one.
Comprehensive app sec scanning methods.	Automatically find security vulnerabilities in your dependencies while you're developing and testing your applications.
Filter upstream dependencies prior to download.	Prevent the introduction of security vulnerabilities from external dependencies.
Cache upstream dependencies from multiple sources.	A collection of local, remote, and other virtual repositories accessed through a single logical URL.
Sign and protect packages, images, and containers.	Protect important artifacts from being corrupted or overridden.

Engaging the Customer

Questions to Better Understand the Customer's needs	Discovery questions
----- -----	
current state	1. Do you want to move away from Artifactory or Nexus? How is that

going?
2. What challenges does managing these extra tools bring you?
3. How are you currently securing your container images and packages?|
| future state | 1. What if you reduce your total licensing costs and tool chain? ?
2. What challenges do you have with your existing tools and can you predict their cost 2 yrs out?
3. Would you like improve developer experience and ensure greater security compliance? |
| Required capabilities | 1. Could GitLab help you get there?
2. What if you had one, known cost that enabled ALL your artifact management?
3. What if you could cache upstream packages to improve reliability and speed up your builds? |

SECTION: marketing/sales-plays/gitops/_index.md

Overview

Why should you care about GitOps?

- The GitOps Marketing campaign has produced the highest amount of linear SAOs across all segments since launch in April 2020
- Over 45% of our survey respondents at Kubecon EU highlighted that GitOps is a priority for their organization in the short term.
- The interest in GitOps topics was so HIGH that CD Conference (by CNCF) had to spin up a separate GitOps Conference
- GitOps helps you target a completely new persona and usecase - opening up new land and expand opportunities for you

What is GitOps?

If the above has gotten you excited, learn more here about GitOps, why it's important for your customers and how we are different.

Simply said - GitOps takes DevOps best practices used for application development such as version control, collaboration, compliance, and CI/CD, and applies them to infrastructure automation.

Sales play objectives

- Landing new deals with a new persona and usecases
- Expanding existing customers to new teams and usecases

Getting Started {getting-started}

Who to meet {who-to-meet}

The persona interested in GitOps is in general different from your development or engineering organizations. They are most often from the operations, systems, infrastructure, platform and

cloud side of the organization.

| | Typical Roles | Typical Titles |

| - | ----- | ----- |

| Economic Buyer | Director/VP/CIO of IT, Head of IT Infrastructure / Platform Engineering / Operations | SVP of Technology Operations, Sr. Manager Systems Engineering, Cloud Architect, Information Systems Architect |

| User | SRE, Infra Engineer, Sys Admin, Platform Engineer - have to execute frequent repetitive tasks to support dynamically changing elastic environments | DevOps engineer, Architect, Team Lead, DevOps Ninja |

More details here

Keywords to listen for {keywords}

| Infrastructure as code | GitOps | Infrastructure automation |

| Configuration as code | Policy as code | Approvals for infrastructure changes |

| Terraform | Ansible | AWS Cloud formation |

| Weaveworks Flux | Argo CD | Terraform Cloud |

How to identify interest based on activity {identify-interest}

Customers engage with our content from our website, collaterals, videos and campaigns. We can identify a customer's interest levels based on their latest activity - which you can see on SFDC.

1. Identify the Last Interesting moment

1. Identify the topics in the Top consumed content and time spent on it

If both of these include GitOps keywords or GitOps topics - ensure to have the GitOps conversation.

Targeted leads are waiting for attention

Marketing is running a related demand gen campaign.

- A Demand Generation campaign is running across different channels (LinkedIn, Facebook, Google Search...) surfacing new leads from the Focus Account Lists, ICP Total Addressable Market, and Volume accounts. See the flow of the Marketing campaign on Figjam can be found here

- A series of virtual events are scheduled throughout FY22, targeting new and existing Inquiries. Schedule of upcoming Infrastructure Automation/GitOps GTM related virtual events can be found in the FY22 All-Marketing Calendar SSoT

Value discovery {value-discovery}

Common Pains {common-pains}

| Challenges "before scenarios" | So What? "negative consequences" |

| ----- | ----- |

| - How does your infrastructure team manage configurations, policies, variables etc

consistently across your infrastructure? | No consistency, no knowledge sharing, no version control, click ops |

| - Are you able to ensure that changes are reviewed and approved by the right individuals - to ensure minimal disruption to your staging / production environments? | Higher risk as unauthorized changes can be shipped to production - causing performance issues / downtime, high skilled / highly paid resources may be doing menial tasks |

| - Is your infrastructure team able to consistently repeat the steps to setup an environment every single time? | No standardization, manual process - more error prone |

More questions here

Common benefits {common-benefits}

| Desired Future State ("After Scenarios") | So What? ("Positive Business Outcomes") |

| ----- | ----- |

| More automation | Less risk as manual repetitive tasks are error prone |

| Faster mean time to repair | Can be rolled back rapidly to a working definition of the infrastructure rather than troubleshooting before roll-back - resulting in faster time to repair |

| Faster time to value | Move from manual Click ops to GitOps to deploy more often |

| Compliant | Compliance is automated as every change is tracked |

| Reduced security exposure | All changes can be reviewed and approved, security for infrastructure code can be embedded within the pipeline |

Required capabilities {required-capabilities}

'GitOps = Infrastructure as Code + Merge Request + CI/CD'

| Required capability | Customer Metrics |

| ----- | ----- |

| Version control for infrastructure code | Improved time to value - less manual, less error prone, more automated |

| Change control and collaboration for infrastructure | Lower change failure rate - more controls, more reviews and approvals |

| Compliance & Auditing | Lesser time spent in auditing, fewer compliance issues |

| CI/CD - test automation, pipeline configuration management | Higher deployment frequency - more automation |

| Rollback | Lower mean time to repair - can roll back to working definition of infra before troubleshooting |

Positioning value {positioning-value}

Elevator pitch

Have you faced infrastructure downtime and have not been able to trace it back to who made the changes, what changes were made and who approved it? Infrastructure automation with GitLab helps you bring Application DevOps best practices of collaboration, version control, CI/CD & Compliance to Infrastructure.

Value Proposition (How GitLab does it?)

Unlike other vendors, GitOps with GitLab helps you manage physical, virtual and cloud native infrastructures. We use a tight integration with industry-leading infrastructure automation tools like Terraform, AWS Cloud Formation, and the like to meet you where you are - all with a single application.

Detailed section on How GitLab meets the market requirements [here](#)

Differentiators (How GitLab does it better?)

- Most competitive solutions require 5-6 integrations to achieve the GitOps workflow. GitLab offers version control, CI/CD and container registry & out of the box integration for config management, orchestration & infra provisioning.
- Better traceability across the workflow - GitLab can tie an infrastructure deployment all the way back to the change that was made - which is difficult in a workflow that is tied together with multiple solutions.
- Most competitors support predominantly cloud native - GitLab meets customers where they are supporting On-premise & cloud, physical, virtual, cloud native infrastructures
- Agent-based and Agentless approach - giving customers a choice to pick the right approach for their environments

More details [here](#)

Competitors

Primary competitors: Flux (Weaveworks), Argo CD, Terraform Cloud

Secondary competitors: Codefresh, Transposit, Red Hat/IBM

Detailed competitive against primary competitors [here](#)

Handling Objections

Typical questions:

- I don't use Kubernetes, so GitOps is not relevant for me
- Our environment is too complex for GitOps
- GitOps gives more access to developers to fiddle with deployments, and infra teams are not comfortable with that
- (Infra / DevOps Engineer) I'm going to lose control over my work and environment

Detailed list of Q&A [here](#)

Sales Play Tactics {sales-tactics}

SAEs and AEs {sals-aes}

How to identify if you need to lead with a GitOps conversation?

Before discovery

1. Familiarize yourself with the GitOps sales play above - at a minimum watch the enablement

video.

1. Ensure you are talking to the right persona - typically this is not a developer, could be a team lead, system architect, cloud architect -> from the infrastructure / operations side of the house.

1. Identify if the last interesting moment on 'Pathfactory for Sales' on SFDC is related to GitOps (use the keywords to determine this)

1. Identify the top content viewed by customer on 'Pathfactory for Sales' on SFDC is related to a GitOps topic

During discovery

1. Use the keywords listed above to identify if a lead is interested in a GitOps conversation

1. Familiarize yourself with the top discovery questions, objection handling and differentiators for GitOps. Note it is very different from other conversations - as the persona we talk to is different

1. Ensure you are able to identify business objectives and priorities during discovery. These could be one or more of the following:

- Infrastructure automation
- Managing cloud native environments
- Multi cloud / kubernetes adoption
- Compliance related to infrastructure

1. After your call, consider emailing your customer using one or more of these email templates custom made for GitOps conversations. Feel free to update the call to action to any of the artifacts from the Pathfactory track for GitOps

During evaluation

1. Share GitOps related customer references

1. Share technical demos, webinars that are part of the pathfactory track for GitOps

1. Share Gartner Peer Insights

1. Work with your SA to showcase a technical demo of GitOps

1. After your call, consider emailing your customer the GitOps Demo email template custom made for GitOps conversations.

During negotiation / decision making

1. Show how we are different

1. Share the Forrester TEI report from the pathfactory track for GitOps

1. Use the ROI calculator to showcase the value of using GitLab as a single application over other solutions

SA {sas-tams}

How to identify if you need to have to lead with a GitOps conversation?

Before discovery

1. Familiarize yourself with the GitOps sales play above - at a minimum watch the enablement

video.

1. Ensure you are going to meet with one of the right user personas.
1. Familiarize yourself with the top discovery questions, objection handling and differentiators for GitOps.

During discovery

1. Ask the discovery questions. Listen to the customer and understand their pains and challenges.
1. As you hear their pains, challenges, business objectives and priorities, start using their own terms when explaining to them how GitOps with GitLab can help them.
1. Understand their technical requirements. For example, look to get answers to the following technical discovery questions:
 - Do their applications require a hybrid cloud infrastructure or multi-cloud?
 - Do they have any hard-dependencies on any infrastructure-as-code tool? e.g. Terraform, Ansible, etc.
 - Do they need GitOps for K8s, non-K8s or both?
 - In the case of K8s, are their clusters available outside their firewall?

1. Be prepared to do some competitive objection handling

During evaluation

1. Prepare your own GitOps environment for demo purposes by following the steps from the GitOps lab of the SA CD Workshop. This lab covers AWS as a cloud provider. If you'd like to add Google and/or Azure, you can extend your environment by leveraging our public-facing GitOps demo.
1. Share technical demos, webinars that are part of the pathfactory track for GitOps
1. If the customer requires you participate in a PoV, gather the PoV requirements and prepare to execute the PoV. Some helpful resources to help you prepare are:
 - gitops slack channel
 - sconfigure slack channel
 - GitOps Engineering
 - GitOps TMM
 - GitOps PM

SDR {sdrs}

How to identify if you need to have a GitOps conversation with a lead?

Before your outreach / conversation

1. Identify where the lead is from -> See if the lead is from a GitOps campaign which has been generating targeted leads for GitOps
1. Identify if the last interesting moment on 'Pathfactory for Sales' on SFDC is related to GitOps (use the keywords to determine this)
1. Identify the top content viewed by customer on 'Pathfactory for Sales' on SFDC is related to a GitOps topic
1. Use the keywords listed above to identify if a lead is interested in a GitOps conversation

1. Ensure you are talking to the right persona - typically this is not a developer, could be a team lead, system architect, cloud architect -> from the infrastructure / operations side of the house.

1. Ensure you are familiar with the top discovery questions, objection handling and differentiators for GitOps. Note it is very different from other conversations - as the persona we talk to is different

Customer outreach / conversation

1. There are a number of high performing outreach sequences available - use one that is already available and customize as required

1. Use the SDR Call Script for Land / Expand

1. Use the content from the GitOps Pathfactory track to share with your lead. You can get the content links (including tracking) directly from Pathfactory for Sales through SFDC. They are categorized by the stage in the customer's journey.

Resources {resources}

Recommended Email templates {email-templates}

Here are a few recommended email templates you can use based on the stage of the customers journey.

- Awareness: Here's how infra teams can move at the pace of development
- Consideration: Achieve multi-cloud multi-k8s deployments with GitOps
- Decision/Purchase: Learn how Kiwi.com deploys infrastructure and application within 3 minutes!
- Technical Demo: Here's how your team can automate infrastructure deployments

Services {services}

GitLab Professional Services help customers become efficient in GitLab quickly. GitLab (or a GitLab partner) offers a number of service offerings to support customers.

For the GitOps sales play, consider asking your customer about their workforce's proficiency with git, GitLab, and GitLab CI as they are foundational elements to GitOps. If they are not strong in all of these topics, consider positioning GitLab with git Basics training and/or GitLab CI/CD training.

Advisory/Consulting services to help with GitOps rollout are planned to be rolled out later this year. Please register your interest for a GitOps Advisory offering here to help PS effectively prioritize!

As you position services, you can use our Services Pitch Deck to help establish the value of engaging with PS. Other services can be found in our Complete list of professional service offerings

Talk with @em in the professional services slack channel to learn more.

Webinars, e-books, whitepapers, videos {resources-list}

- Pathfactory track for GitOps to share with customers
- Complete list of presentations, web pages, whitepapers, blogs and videos available here.
- GitOps Enablement presentation

Customer Stories {customer-stories}

- BI Worldwide
- Wag
- Nebulaworks
- SURF
- kiwi.com
- VMWare
- ValidaTek

And many more here

- Gartner Peer Insights

Finding Last interesting moment and most viewed content on SFDC {lim-anchor}

- Last interesting moment is in the Marketing info section of SFDC
- Top content consumed by time - is in the Pathfactory for sales section of SFDC

SECTION: marketing/sales-plays/gitops/first-order.md

GitOps Sales Play for FO AEs

View this page in a Google Doc

Part 1: Before the Discovery Call

1. Familiarize yourself with the GitOps Sales Play and watch the enablement video.
1. Talk to the right persona - typically not a developer, could be a team lead, system architect, or cloud architect from the infrastructure/operations side of the house.
1. Check that the last interesting moment and top content viewed is related to GitOps.
1. Create a custom pitch deck incorporating these slides as needed:
 - GitOps messaging
 - original deck

Part 2: The Discovery Call

1. Listen for these keywords to identify if a lead is interested in a GitOps conversation.
1. Familiarize yourself with the top discovery questions, objection handling and differentiators for GitOps. NOTE: This is very different from other conversations - the persona we talk to is different.
1. Identify business objectives and priorities during discovery. These could be:
 - Infrastructure automation

- Managing cloud native environments
 - multi-cloud / kubernetes adoption
 - compliance related to infrastructure.
1. After your call, follow up with an email, which should include:
 - any information they requested (resources you might include),
 - how that information can be helpful for their research,
 - an offer to continue researching these topics on their behalf,
 - mutually agreed upon next steps.

Part 3: POV & Evaluation

1. Set up the evaluation with the appropriate internal resources
1. Do the following before sending out a trial key
 - Mutually agree upon success criteria for the 30-day evaluation period ("If at the end of 30 days, we prove [these criteria], then we will consider this trial a success")

Success criteria examples:

- Store and Run an Ansible Playbook in GitLab
 - Incorporate the above into a pipeline
 - Scan x% of our code base (because of the language)
 - Build a CI pipeline and have a basic one working
1. Send an email outlining and confirming the success criteria
 1. Work with your SA to showcase a technical demo of GitOps and/or share technical demos, webinars, and other resources.
 1. Share customer stories and Gartner Peer Insights
 1. After each call during the trial period, send an email with the progress achieved against the success criteria and what should be worked on the following week.

Part 4: Negotiation / Decision-Making

1. Use the "How GitLab Does it Better" section as supporting material to build the business case for GitLab (ROI) with the customer in the custom deck for the champion present to the economic buyer.
1. Share the Forrester TEI report
1. Use the Cost Comparison Calculators to show the value of using GitLab as a single application over other solutions.

Sales plays

1. Sales Playbook for Upsell Premium => Ultimate
 - Message house

- Planner doc for visibility

Additional sales plays will be added as they're available

Other resources

SECTION: marketing/sales-plays-cicd/message-house-premium-to-ultimate.md

Message house

Context

Budget and influence are key for this play, so our basic assumption is that upleveling to someone's boss isn't going to be enough all the time - people need to reach out to additional business units, namely security, and bring in "fresh" teams and opportunities within existing accounts.

- Additionally, we need to enable and equip current Premium customers and their teams to be more "active champions" by showing them the light that is the value of Ultimate. When thinking about the value of Ultimate at the highest level

Think security and reducing risk, protecting the business's intellectual property and sensitive data, enabling modern CD with compliance and audit controls, and providing visibility/insights at different levels from ICs to executive insights

The who

- Economic buyers: CISO or Security Manager, VP of Security, Director of Security, VP of IT or CTO, App/Dev Director
- Technical influencers: Chief Architect, App Dev Manager

Messaging and Positioning

Headline: Dev+Sec+Ops all under one roof

Subheader: GitLab Ultimate makes it happen

Positioning statement	GitLab Ultimate streamlines the software delivery process by embedding security and compliance into your DevOps workflows, unifying teams under one roof.

| Elevator pitch | GitLab Ultimate enables DevSecOps by optimizing and accelerating software delivery while managing priorities, security, risk, and compliance. |

| Long description | GitLab Ultimate helps organizations and teams achieve DevSecOps via enterprise-level application security capabilities, advanced insights/analytics at the project, group, and instance level, and industry-leading continuous integration and delivery. |

| Key-Values | Single app with end-to-end visibility and insights | Embedded security that's

contextual + congruent to DevOps processes | Leading SCM, CI, and code review in one | Transparent and collaborative |

|-----|-----|-----|-----|
-----|

| Promise | Lovable developer UX with executive visibility | Built-in security and compliance shifted all the way left | No plugins or costly integrations to maintain | Streamline processes and empower teams to make better decisions |

| Pain points | In a constant state of asking "what changed!?" | Increased risk of vulnerabilities, difficult audits | Complexity, added overhead | Inefficient, stifles innovation |

| Why GitLab | Reduce exposure and unify teams | Reduce risk, easily scalable | Completely integrated from idea to production | Single source of truth to focus on remediation, less friction |

Additional Ultimate value:

- Enterprise-grade priority support, including 24/7 uptime support, a dedicated Customer Success Manager (CSM), and upgrade assistance are all still included with Ultimate.
- Access to free guest users
- Project, portfolio and requirements management value
- Modern CD with compliance

| Proof points | Glympse, BI Worldwide, Jasper, Wag!, HERE Tech |

content subject to change as we iterate and source feedback! All feedback is welcome- everyone can contribute.

Sales play name {sales-play-name}

Premium => Ultimate CI/CD: find and use the sales playbook here.

Description {description}

Convert accounts from premium to ultimate that are using GitLab CI

Type {type}

Upsell and expand

Supporting marketing campaign {supporting-marketing-campaign}

See the epic in GitLab

Geos/countries {geos-countries}

NA, EMEA, what else? APAC is in consideration, looking for feedback on if other team members agree or have past data to validate successful results with CI/CD campaigns

Target accounts {target-accounts}

Full list of Premium accounts (added March 22nd 2021): [here](#)

Target segments and key messages for each {target-segments}

Emphasis on large due to the relation to verticals + regulated industries, but all should be included

ENT: Do more with less when you expand your benefits from using GitLab by adding Security capabilities of GitLab Ultimate all within the DevOps platform your teams already know and love. Bring security scanning to the developer's existing workflows to empower them to find and fix vulnerabilities, while at the same time simplifying your tool set and eliminating integration efforts. Unify teams to work more efficiently and collaboratively through a shared platform so you can deliver business value faster while staying secure and compliant.

MM: Don't let security slow you down. Improve efficiencies, collaboration, and eliminate bottlenecks by enabling security capabilities on your existing GitLab Platform. Spend time on planned work instead of maintaining and integrating tools. Get expertise and support that assures you can meet your strategic goals along the way.

SMB: Go fast, go safely, and do it easily by using even more of the GitLab platform. Take your continuous integration up a notch by seamlessly adding security scanning and collecting the vulnerabilities all in one easy-to-use place. You don't have to be a security expert to see your risks and where to resolve them. Start right before inefficiencies get in the way of scaling out successfully.

PubSec: Reap the full rewards of the platform you are already using. Upgrade to Ultimate to manage risk from security and regulatory compliance by identifying vulnerabilities and compliance issues before the code ever leaves the developer's hands. Stop worrying about audits!

Sales teams {sales-teams}

SAEs, Account managers, and CSMs

Pipeline goal {pipeline-goal}

See this section in the working doc

Target personas {target-personas}

Budget and influence are key for this play, so our basic assumption is that upleveling to someone's boss isn't going to be enough - people need to reach out to additional business units, namely security, and bring in "fresh" teams and opportunities within existing accounts. Additionally, we need to enable and equip current premium customers and their teams to be more "active champions" and essentially show them the light that is the value of Ultimate. (Think

risk! and protecting the business)

Economic buyers:

CISO or Security Manager, VP of Security, Director of Security, VP of IT or CTO, App/Dev Director

Technical influencers:

Chief Architect, App Dev Manager, DevOps lead

Target verticals {target-verticals}

With the heavy tie to security for value with Ultimate, all regulated industries should be a focal point

Healthcare, government, finance, telecom

Partner routes to market {partner-routes-to-market}

Reseller?

MSP?

GSI?

Disti?

Elevator pitch {elevator-pitch}

Get maximum benefits from using GitLab by adding Security capabilities of Ultimate all within the DevOps platform your teams already know and love. Bring security scanning to the developer's existing workflows to empower them to find and fix vulnerabilities, while at the same time simplifying your tool set and eliminating integration efforts. Unify teams to work more efficiently and collaboratively through a shared platform so you can deliver business value faster while staying secure and compliant.

Value proposition {value-proposition}

1) Stop choosing between velocity and risk · test all of your code, on every commit, automatically, i.e. not just critical apps or periodic scans - without costly tool chain integrations.

2) Better leverage your scarce security resources by putting app sec tools, that are meant for the developer, into the hands of the developer, so they remediate more and earlier.

3) Improve visibility while at the same time reducing friction between processes and tools used by dev and app sec teams.

Other thoughts/notes:

Everything you get in Premium as well as free guest users, 50,000 compute minutes, and more. GitLab Ultimate provides the single tool DevOps teams need to find and fix vulnerabilities in application code and its environments and to manage their risk from detection through remediation.

GitLab empowers and unites developers and security pros alike using repeatable, defensible

processes that automate security and compliance policies from development through production.

Partner value proposition {partner-value-proposition}

Partners will appreciate the size of the Ultimate deals as well as the stickiness that use of its capabilities provides. Security is an ideal candidate for professional services assistance as well. Become an expert in end-to-end DevSecOps through a platform already used and loved by many.

GitLab capabilities featured {gitlab-capabilities-featured}

Which GitLab stages/feature make up this sales play:

Create, Verify, Release, Secure, Software Supply Chain Security

Key capabilities in Ultimate center around security, compliance, insights/analytics, and releasing better + faster

Compliance dashboard - high level view of project compliance status and merge request approvers

Release analytics- An aggregated view of all release metrics for each of the projects associated to a group.

Auto rollback- Automatic rollback to the last successful deployment.

DORA 4 metrics (Deployment frequency available now, lead time scheduled to ship in 13.11), the remaining two are on the roadmap later this year)

Static Application Security Testing - check for potential security issues by evaluating static code but with Ultimate, see the results of the scans directly in the MR pipeline and also in the Security Dashboard, alongside all of the additional scans below that come with Ultimate:

Dynamic Application Security Testing - analyze review applications to identify potential security issues on running web applications before deployment

Secrets Detection - avoid exposing secrets and credentials for potential exploit.

Dependency Scanning - evaluate third-party dependencies to identify potential security issues.

Container Scanning - analyze Docker images and check for potential security issues.

License Compliance - identify the presence of new software licenses included in your project and track project dependencies. Approve or deny the inclusion of a specific license.

Coverage-guided Fuzz testing API Fuzz testing - surface security and logic flaws not identified as known vulnerabilities.

Security Dashboard - visualize security status for projects.

Vulnerability Management

Security Approvals in Merge Requests

Ultimate also includes priority support (4 business hour support), upgrade assistance, and a Customer Success Manager who will work with you to achieve your strategic objectives and gain maximum value from your investment in GitLab.

Which combination delivers the overall outcome to a customer {which-combination-delivers-the-overall-outcome-to-a-customer}

Identifying customers who are already using GitLab Premium and leveraging us for SCM and CI

capabilities, as well as have a need for reporting, insights, analytics, and security. We want to understand their challenges and primary objectives. Often they have started shifting security left but struggling to scale across all projects. Bonus points if they're trying to extend their automation or start automating their deployments and have a need for modern CD with compliance. We want to understand what they need first, and then plug in what value we can provide in Ultimate among the major themes: Security, compliance, releasing safely and efficiently (not trading velocity for risk or quality and having control over deployments/environments), end-to-end visibility and insights, and collaboration that unifies teams.

A good example to portray the power of CD/Security in Ultimate: combining Review Apps and DAST. Only GitLab can deliver DAST results to the developer within their pipeline before the code is merged. We do so by running the dynamic scan against the review app. Ensuring your apps are secure and compliant doesn't stop once the code has been shipped. GitLab Ultimate also provides container security for runtime monitoring and protection.

Where should you land vs expand? {where-should-you-land-vs-expand}

Land SCM/CI and Expand CD/Security

CD: Ultimate is ideal for projects with executive visibility while managing priorities, security, risk, and compliance.

Security: With Ultimate you can achieve advanced DevOps maturity with enterprise-level application security capabilities, out of the box, without custom integrations.

...

Differentiators {differentiators}

How does GitLab uniquely deliver this business outcome vs. competitors?

1. Single application with end-to-end visibility and insights

From developers to managers to execs. Lovable developer UX with executive visibility. No one asks "what changed?"

Reduces exposure and unifies teams- with emergent advantages including unparalleled visibility and insights and much easier traceability.

2. Embedded security that's contextual and congruent to DevOps processes

Built in security and compliance shifted all the way left (and all the way right) - reduces risk and scales

Consistent compliance to policy, for cleaner and easier audits

3. Leading SCM, CI, and code review in one platform

Completely integrated from idea to production

No plugins, etc. to maintain

4. Transparent and collaborative

Single source of truth with built-in collaboration to focus on remediation, less friction

Auditable - see who changed what where, when including policy exceptions.

In addition to product advantages,

GitLab is open-core, source available, and home to a vibrant community and DevOps subject matter experts with world-class support.

Popular among developers making shift left easier to adopt.
Scalable with proven benefits in some of the largest Enterprises.

Differentiator notes and brainstorming

Reporting/analytics/insights in one place

The only DevOps vendor included in last year's Gartner AST MQ

Leading CI/CD capabilities (Forrester Wave), SCM, code review

Unified deployment and monitoring

Automated and integrated CD, flexibility and control over how and when you deploy your apps without forced tradeoffs

Automated and integrated security. No need to integrate security scans into your CI Pipeline - we've done it for you!

Compliance dashboard to surface non-compliance and policy-driven automation to simplify audits.

Simplify your tool chain! A single platform for end-to-end DevOps can reduce your security and risk by eliminating plugins and improving access control and transparency.

Validation/customer stories {validation-customer-stories}

wip, for now: Glympse, BI Worldwide, Jasper, Wag!, HERE Tech

Offer and CTA {offer-and-cta}

Landing page with a valuable asset (tbd) and offer with Ultimate free trial for 30 days.

"Try Ultimate today" or something in that realm?

placeholder

Potential tagline: Status quo doesn't get it done. "Deliver faster. Deliver secure. With GitLab"

Other ideas are themes around "time waits for no one, plan for the future today and be ready to grow, etc."

Buyer's journey

tbd

Objection handling: WIP {objection-handling-wip}

See Security FAQ slides and Objections on DevSecOps use case page

Why is the price 5x?

What features or value justify the price jump?

Answer:

What's been added over the last 12 months? I didn't see a lot of value the last time I looked at Ultimate

Answer:

Lots of value maps to project management, what's the CI/CD value for adopting Ultimate? What about security?

Answer:

I've already got security scanners that I can use

Answer:

I've already spent so much on AppSec tooling, not to mention DevOps

Answer:

We don't even use a lot of what we spend money on today

Answer:

How do I justify this to my boss?

Answer:

We're way too immature and early on in our journey to think about something like Ultimate

Answer:

I've never heard of ya'll. I've known of our current vendor for 20 years or more. "If it ain't broke, don't fix it"

Answer:

"Just not good timing right now"

Answer:

"There's a plugin for that" or "there's an action for that" and they're FREE

Answer:

Specific competitor objections.?

Note: Think of a sales play as a recipe. If you follow the recipe, we can achieve more predictable, consistent results. And if we find an asset or approach that works best (or flops), then we can tweak the recipe to continuously improve. If you have improvements to suggest, please contribute comments to this MR to suggest your edits and upvote on others.

Jump to Sales Play Tactics

Sales Play Quick Reference Guide (internal)

Overview

Objective - Convert landed accounts that are already using CI/CD to expand from GitLab Premium to GitLab Ultimate.

Who is this sales play for?

Primary: SAEs and AEs who call on one or more existing GitLab Premium customers

Secondary: SAs and CSMs who support one or more existing GitLab Premium customers

Note: This play is FYI only for SDRs because it is upselling tiers, not necessarily expanding seats.

Who to meet

Ideal Customer Profile - Existing GitLab Premium customers already using CI/CD

Bonus points for:

- Organizations at lower maturity level undergoing or planning to undergoing transformation
- Siloed teams with disparate tools, especially security, lacking visibility at the individual level and executive level
- Organizations with stringent regulatory security or compliance requirements

Target Buyer Personas

Persona role	Possible titles
Economic buyers	CISO or Security Manager, VP of Security, Director of Security, VP of IT or CTO, App/Dev Director
Technical influencers	Chief Architect, App Dev Manager
Other Personas to consider	Infrastructure Engineering Director, Release and Change Management Director

Target Account Lists

Account list

Getting Started

Consider the following questions:

- What has prevented the customer from moving to (or considering moving to) GitLab Ultimate?
- Does the customer have any strategic initiative or priority to which upgrading to Ultimate would align nicely?
- Are you engaged with the right personas/teams (see Target Buyer Personas above)?
- Do you have access to power/authority (a business decision maker)?
- Who are your champions within the account?
- Are the capabilities and PBOs that are enabled by GitLab Ultimate important to the customer?
- Why or why not? How do you know?

Value Discovery

Common Pains

GitLab Premium customers may be experiencing one or more of the below challenges:

Challenges ("Before Scenarios")	So What? ("Negative Consequences")
Difficulty writing secure code without becoming security experts	Increased risk
Vulnerabilities found late in the SDLC	Costly remediation, blocks production at last minute
Costly triaging and tracking of vulnerabilities	Inefficient use of scarce security resources, lengthy remediation process

| Managing complex tool chains, plugins, and fragile automation scripts | Added cost, maintenance, and admin overhead |

| How to ensure scans are executed consistently and policies applied | teams may skip scans or use exceptions to push ahead, difficult to see across tools when this happens |

| Security costs are unpredictable or concerning as DevOps scales | must find more money as number of apps grows |

An in-depth view of security pain points and probing questions around them can be found on the DevSecOps resource page

Common Benefits

By upgrading from GitLab Premium to GitLab Ultimate, customers may experience one or more of the below benefits:

| Desired Future State ("After Scenarios") | So What? ("Positive Business Outcomes") |

| ----- | ----- |

| Greater efficiencies for both security and dev | less risk and greater velocity of DevOps |

| Consistent compliance to policy | less risk of vulnerabilities in production and easier audits |

| Reduced security exposure, more scanning finds more vulnerabilities | reduced risk to finance and reputation |

| Predictable security costs that scale with DevOps | able to confidently forecast and budget as DevOps and App Sec both scale |

Required Capabilities

To achieve the positive business outcomes highlighted above, what required capabilities does the customer need to solve for and how will success be measured?

| Required capability | Customer Metrics |

| ----- | ----- |

| Comprehensive app sec scanning methods | percent of apps scanned with multiple scan types |

| Scan results delivered to the developer in their CI pipeline | vulnerabilities found pre-prod |

| Security governance | time spent on audits, fewer compliance issues |

| Option to use 3rd party scanners | metric? |

| Vulnerability management | mean time to resolution |

Engaging the Customer

Note: maybe we use this link as mvc1 and then change the resource pages to the suggested format?

| Questions to Better Understand the Customer's needs | Discovery questions |

| ----- | ----- |

| current state | 1. Are you wanting to shift security left? How is that going?
2. What

security tools are you using today?
3. How are you currently securing containers and Kubernetes?|

| future state | 1. What if you could simplify your shift-left efforts?
2. What challenges do you have with your existing tools and can you predict their cost 2 yrs out?
3. Would you like to better protect containers and K8s? |

| Required capabilities | 1. Could security integrated into CI help you get there?
2. What if you had one, known cost that enabled ALL your security scans, with results to the developer in their CI pipeline, along with vulnerability management for the security pro? What if you could either eliminate some existing security tools or reduce their use/cost?
3. What if you could scan containers and monitor their host and their traffic within K8s clusters? |

Note: if they say they do NOT want to shift left and empower developers to find and fix security flaws, you are probably speaking with a security analyst. Talk to his/her boss, DevOps, or application dev/engineering team.

Positioning Value

Elevator pitch

> With GitLab Ultimate, organizations are able to truly shift security left (and right!) while keeping up with DevOps velocity. Empower developers to find and fix vulnerabilities earlier and security teams to manage risk from detection through remediation. With GitLab, the integration is done for them. No need to fit your security tools into the CI pipeline - it's already built-in! And for ONE predictable cost, even as you scale!

GitLab Ultimate enables IT transformation by optimizing and accelerating delivery while managing priorities, security, risk, and compliance.

Note: Everything you get in Premium plus all security scanners, vulnerability management, security and compliance dashboards, free guest users, 50,000 compute minutes, a named CSM, and more.

How GitLab Does It

How GitLab meets the market requirements for security (link includes benefits, videos, and more.)

How GitLab Does It Better

With GitLab Ultimate, organizations are able to truly shift security left (and right!) to find and fix vulnerabilities earlier while keeping up with DevOps velocity and new attack surfaces of cloud native apps. With GitLab, the integration is done for them. No need to fit your security tools into the CI pipeline - it's done! And for ONE predictable cost, even as you scale!

For one cost, you can:

Scan every code commit on every app (no more choosing because scans are too expensive)
Use multiple scan types to find threats individual scanners might miss
Manage all vulnerabilities found in one place with united collaboration between dev and sec

Easily assess remediation progress

Automate policies and focus on the exceptions not individual inspections.

Advantages of a single application for DevOps and Security together include unparalleled visibility and insights/traceability with consistent compliance to policies and regulatory requirements for cleaner, easier audits.

Key GitLab differentiators include:

1. Detailed and Actionable Scan Results Displayed in MRs created from Feature Branch

Microsoft does this for SAST and Dependencies. Other scan types require integration and bring-your-own licenses.

Veracode, Fortify, Synopsys struggle to scan quickly within the CI pipeline and require DIY integration.

1. Block MRs based on Security Policy

Microsoft does this for SAST and Dependencies. Third party scans likely require customizing CI pipeline.

1. Compliance Management

GitLab just launched Compliance Pipeline Configurations where customers can enforce even more separation of duties by setting up a single pipeline definition for a specific compliance framework (PCI, HIPAA, or even a custom one). All projects using that framework will include the predefined pipeline automatically.

GitLab Compliance Management secures more than just the code but the software factory itself, a big concern after the Solarwinds breach.

GitLab makes compliance easy

1. Fuzz testing, including API testing

No one else integrates Fuzzing nor API testing into the CI pipeline.

Fuzzing can help find flaws not identified by a security CVE (signature of a known vulnerability)

Fuzzing is taking on new importance with cloud native apps and Infrastructure as Code

1. Offline environments

Especially important to regulated industries like government and Financial Services

Most scanners require punching out of the secured network for the latest security rules/updates. We can containerize these for running in a disconnected environment.

1. Vulnerability management (vs point solutions)

Traditional app sec vendors (Veracode, Fortify, Synopsys) sell a Security Center to manage vulnerabilities found from each of their scanners (all sold separately!). GitLab not only comes with vulnerability management, but it's in the same tool that the developers use so nothing is lost in translation. In addition, you can easily pull in third party scan results into the CI pipeline (MR) to compare findings, somewhat similar to ThreadFix. Is your customer paying for this or other tools to do this?

see provided link for additional details including value and videos

Proof points

Proof points

Objection handling

Most common objections

| Objection | Response |

| ----- | ----- |

| How does your scanning capability compare to leading scanners? How accurate are they? | accuracy slide, G2 SAST |

| Can you integrate with my incumbent scanner? | We can work with other scanners or replace them |

| Ultimate is 5x. | Why Ultimate |

Other objections and responses can be found in the FAQ deck with more detail on Potential objections here.

Services

General PS deck

GitLab (or a GitLab partner) offers the below services to help accelerate time to value and mitigate risk:

Security Essentials Training that will enable students to take the security specialist certification.

Secure Advisory Services can help provide guidance to a customer who wants to rebuild their security processes to shift left and/or secure their SDLC Supply Chain. The target audience for these services are a central security or SDLC Governance/Compliance team. Pricing varies on this offering. Talk with @em in the professional services slack channel to learn more.

Sales Play Tactics {sales-play-tactics}

These are Sales prescriptive actions to initiate engagement with target audience for Premium to Ultimate upgrade of existing GitLab CI users. Strategy and actions differ by market segment with SMB relying on marketing to drive inbound contacts initiated by the customer and ENT/MM primarily using the play to guide conversations initiated by sales.

Enterprise and Mid-market Accounts

Strategy

For Enterprise and MM, sales will do active outreach to customers to engage them in conversation using the recommended email templates and conversation flow below, modifying as needed. These accounts will not be included in the automated email campaign. This allows the SAEs greater control over who is contacted in their accounts, and the contacts can be more personal.

ENT and MM Sales Actions

1.] Review the [target list and prioritize contacts.
1. [] Familiarize yourself with context for this play (above), especially differentiators and objections
1.] Familiarize yourself with the [recommended email sequence and next steps (below).

1.] Use the [three email templates below to reach out to leads.
We have provided a recommended sequence, but choose th
