

t be updated prior to moving the opportunity forward

- For the purposes of this validation the Team Roles of Opportunity Owner, Account Executive, null/Empty are assumed to be the same role and are summed accordingly.
- Validation Rules
 - For individual end users to avoid having their splits erased - see the general automation notes for more details - a number of validation rules have been created. These validation rule prevent the Opportunity Owner from ever being the same user as either the Sales Development Representatives, Primary Solutions Architect.
 - Channel Managers are not included in this Validation rule because they are not paid until after the close, the validation rule would conflict with existing automations and because it is expected that Channel Managers will never have a split Opportunity.

Logic Locations:

- OpportunityClass.maintainTamTeamLookup
- OpportunityClass.maintainTeamMembersToSplits
- OpportunityClass.checkAndConfirmSplitPercentages
- Please also see the OpportunityClass.singleWonOppSplitOwnerUpdate where split are also handled but not directly in alignment with the needs for this process

General Automation Notes

- Salesforce has a default behavior that when an opportunity is updated, any opportunity split that is owned by the old owner of the opportunity is updated to the new owner of the opportunity. This is irregardless of what type of split it is, if it is split or not. Even if we try to work around this exception with an After trigger the SFDC automation fires after any after triggers we write.

Refund Opportunity

Business Process this supports: Decommission Opportunity Process

Overview: For this process to function properly there is a button that has been added to the Opportunity layout. This button should only be visible to users who should be working on our bookings (Deal Desk, Finance Users, etc.). This button, when clicked, updated a checkbox on that opportunity to mark it as a refunded opportunity. If the button is clicked for an already refunded Opportunity, the user will be presented with an error informing them that the refund has already been completed.

Selecting this checkbox on an Opportunity causes the Opportunity trigger to execute a method which will create a full clone of the existing opportunity. Additionally, if the owner of the original opportunity is no longer active, the refund opportunity owner is updated to that user's Manager. If that manager is also no longer active, then the refund opportunity is assigned to the user who triggered the process.

The action does change several values on the Opportunity, mostly to update a number of fields to null or override fields are used to negate our bookings numbers. Specific changes include:

The values in the following fields will be carried over and flipped to negative on the refund opportunity (i.e. grab the value from the originating opportunity, and stamp the inverse on the

refund opportunity created via button):

- Recurring Amount
- True Up Amount
- ProServ Amount
- Other Non-Recurring Amount

The values in the following fields will be carried over as is from the originating opportunity:

- DR - Partner
- Resale Partner
- DR - Partner Deal Type
- DR - Channel Manager
- Distributor
- Resale Channel Manager

Note: Because this process uses a checkbox field, it is also possible to trigger refunds through a data load or similar mass update.

Logic Locations:

- OpportunityClass.cls
- Code Unit:
- CreateRefundOpp
 - Create Refund Opportunity Button

Link Credit Opportunities and Contract Reset Opportunities

Business Process this supports: This supports the Deal Desk process of processing Credit Opportunities and Contract Reset Opportunities. See the Sales Order Processing Handbook Page

Relevant fields

- Opportunity.ContractResetOpportunityc
- Opportunity.TotalNetARRCreditc

Overview:

- When an Opportunity meets our entry criteria and it is looking up to another opportunity through the ContractResetOpportunityc field the TotalNetARRCreditc on the related Contract Reset Opportunity is updated to be the Sum of the Net ARR of any Credit Opportunity that meets our criteria. Some of the changes that may cause this code to run would be:
 - A Credit Opportunity moving from a valid stage to(from) a invalid sage (ex: Closed won to Duplicate)
 - The Net ARR on the credit Opportunity changes (and it is in a valid stage)
 - The lookup field to the Contract Reset Opportunity is inserted, deleted or changed
 - The credit opportunity with a Contract Reset Opportunity populated is inserted, deleted or undeleted

Logic Locations:

- OpportunityClass.LinkCreditOppsToContractResetOpps
- OpportunityClassTests.LinkCreditOppsToContractResetOpps

SQS [Sales Qualified Source] Override

Business Process this supports: Sales Cycle & Operations Tracking Sales Qualified Source in the Opportunity

Overview: There are times in which we may need to override Sales Qualified Source. In this event, we have a system that will allow this. This ability is limited to James Harrison and Colleen Farris. To override Sales Qualified Source, enabling user with perform the following steps:

1. Check the Override SQS checkbox
2. Select the updated value in Sales Qualified Source

Once this is complete, a validation rule will prohibit anyone other than the above mentioned users from editing this field. All automation that updates this field includes criteria that excludes them from firing if the Override SQS checkbox is checked.

Logic Locations:

- Permission Set : Edit SQS Override
- Validation Rule : Cannot edit overridden SQS

Maintain Channel Manager

Business Process this supports: This automation maintains the correct Channel Manager on Opportunities. This is important for tracking which Channel Manager gets compensated on which Opportunity.

Overview:

- Currently the process that stamps Channel Managers on Opportunity records is being updated more details are coming soon

Logic Locations:

- Coming soon!

SA Team Stamping

Please see our internal document for details.

CSM Team Stamping

Business Process this supports: This process supports our CSM Team Tracking Alignment and Compensation. See the business handbook section Coming Soon

Relevant fields

- User Object:
 - [Comp] CSM Team (TAMTeamc)
- Account Object:
 - Customer Success Manager (TechnicalAccountManagerLUc)
- Opportunity Object:
 - [Comp] CSM Team (CompTAMTeamc)

Overview:

- On Opportunity creation and closure the CSM Team of the user in the Customer Success Manager on the Opportunities related account is stamped onto the Opportunity in either of the following cases
 - If the CSM Team of the user in the lookup field is Scale
 - If the Order Type on the Opportunity is one of the following: 2. New - Connected, 3. Growth, 4. Contraction, 5. Churn - Partial, 6. Churn - Final

Logic Locations:

- OpportunityClass.stampTAMTeam
- OpportunityClassTests.stampTAMTeam
- OpportunityTrigger

GitLab Admin Contact Required

Business Process this supports: Digital Journey - In order to deliver the digital journey enablement series to new customers, we need a way to identify contact roles for certain personas in the business to receive the right material.

Overview: For the Commercial and Enterprise markets, we will require identifying the GitLab admins at each Account at the time of Opportunity approval submission. When the "Submit for Approval" button is clicked in the Opportunity, logic will run the check criteria (defined below) on if a GitLab Admin is required and if there is currently one defined. Providing a GitLab Admin is defined by having at least one contact on the Account that has Role CONTAIN GitLab Admin. Note: This contact can have other roles defined in this field in addition to GitLab Admin.

There will be Salesforce validation checks at stages 4+ to ensure at least one gitlab admin has been identified to support the account via Digital Programs. At Stages 4+ and deal close and if the criteria below is met, there are two potential results:

1. There is already a GitLab Admin defined on the Account.
 - Result: The submission continues to the normal screen for advancing stages or Closed Won Reason requirements for approvals.
1. There is not a GitLab Admin defined on the Account
 - Result: An error screen will display instructing the user to define a GitLab Admin. Once the GitLab Admin is defined, they can re-submit the Opportunity to advance the stage or closed-won for approval.

Criteria to enter this logic:

- Web Portal Purchase is Unchecked (false value)
- Order Type 2.0 is 1. New - First Order OR 2. New - Connected OR 3. Growth OR 4. Contraction

Logic Locations:

- Flow: Opp Approval Field Check 3.0 GitLab Admin Check

Downgrade Reason Required

Please see our internal document for details.

Next Steps History

Business Process this supports: Sales tracks their next steps in the Next Steps field. It is important to have a historical log of these "Next Steps" values so that they can be referenced in the future. We have created a system to streamline this process so that sales will only need to update what the true "Next Step" is and the system will log the historical data.

Overview: On the Opportunity, when the Next Steps field is updated, the previous value of this field will be stamped into the Next Steps History field. This will be complete with a timestamp and will keep the previously existing value of Next Steps History to keep a full log.

Criteria to enter this logic:

- Next Steps has been changed/updated OR the Opportunity has just been created.
- Next Steps previous value was not a "blank" value.

Logic Locations:

- Workflow Rule: Next Steps History
- Field Update Action: Update Next Steps History

Integrations

Integration Users

- An Integration User is a dedicated (not used by any human) full Salesforce license that has a custom Profile, Permission Set, and is used for any third-party integrations, like marketing automation, CTIs, data enrichment tools, and for custom API work. Sales Systems will have dedicated integration user for every integration & connections. Integration user credentials shouldn't be cycled without lots of warning and a week lead up.
- Here is a list of integration users in Salesforce.
- For any new requests to establish a new integration, please follow up with systems team by creating an issue with the use case & pertaining to the integration, an AR needs to be created by the DRI to create a new integration user.
- All the integration users credentials will be stored in SalesSystems 1Password Vault

Tesorio Integration

Business Process this supports: Finance Systems Team implements a new Collections Management

Tool (Tesorio). Tesorio will be connected to Zuora and get most of the data it needs to manage running process which also requires Tesorio to be integrated with Salesforce to get some additional data on the customer accounts (i.e. account owner).

Overview: Tesorio integrates with Salesforce using REST APIs. The integration requires a Connected App to be created within Salesforce. The data import from Salesforce are:

- Accounts - One-way sync of account data into Tesorio. Account data is matched with Customers only if a custom field containing the internal id of the customer record from the ERP system is present.
- Contacts - One-way sync of all contacts into Tesorio. Contacts associated with Accounts are linked with customers automatically. If an account has custom fields which are lookups of contacts, they will also come over as contacts within Tesorio.

Logic Locations:

- Tesorio Client

Automations

Email Alerts

Business Process this supports: Sales Cycle & All Operations

Overview: Email alerts are emails generated by an automated process and sent to designated recipients. These actions consist of the standard text and list of recipients for an email. Email alerts are associated with processes, flows, workflow rules & approval processes. Here is the Email Alert Document which lists all the email alerts with associated automation details, email template details & target audience information that are sent from the Salesforce instance. To request deactivating and/or updating these emails alerts for business reasons please create an issue in SalesSystems Board for Systems Team Member to review & make necessary updates.

Logic Locations:

- Email Alerts

Late Renewals Notifications and Closure

Business Process this supports: Sales Cycle - Late Renewal Notification & Auto Close Process

Overview: To keep the Sales Pipeline clean and for a systematic way to notify opportunity owners (and their managers) of renewal opportunities that are at risk of lapsing, automatically close late renewals that fall out of adherence to our Bookings Policy. This automation triggers for all Open Renewal Opportunities based on Quote Start Date in the opportunity. There is an exception process that is built into this functionality as well. This allows Sales Ops to accept exceptions for this automation that would extend the window of when an Opportunity is automatically Closed Lost to 90 days after the Opportunity Quote Start Date. This is accomplished by checking the Exempt Late Renewal Automation checkbox on the relevant Opportunity.

This logic is included in the OpportunityJob to trigger the action (Field Update) & alert. The

recipients who receive these emails are Opportunity Owner, Opportunity Owner's Manager & Renewals Manager. Specific templates have been created to match up with the notifications. The field updates made to the Admin Poke field are used to trigger Troops to send email alerts to the SAs(Primary Solution Architect).

To request updating these emails alerts/recipients/actions, please create an issue in SalesSystems Board for Systems Team Member to review & make necessary updates.

Here is the config table for the automation logic for reference:

For Open Renewal Opportunity Only		Email Template ID used	
Logic[Quote Date in Opportunity]	Field Update	Email Alerts Sent To	
Troops Alerts Sent To			
----- ----- -----			
-- ----- ----- -----			
First Notification - Email Alert - 15 days prior to Quote Start Date			
00X4M00000121nCUAQ Today = Quote Start Date - 15 Days		Admin Poke = 15 days prior lapsed renewal alert1 sent	
Opportunity owner, RM, opp owner manager SAs			
Second Notification - Email Alert - Day of Quote Start Date			
00X4M00000121nFUAQ Today = Quote Start Date		Admin Poke = on the day lapsed renewal alert2 sent	
Opportunity owner, RM, opp owner manager SAs			
Third Notification - Email Alert -30 days after Quote Start Date			
00X4M00000121nDUAQ Today = Quote Start Date + 30 Days		Admin Poke = 30 days prior lapsed renewal alert3 sent	
Opportunity owner, RM, opp owner manager SAs			
Final Notification - Email Alert + Closed Lost Update -46 days after Quote Start Date			
00X4M00000121nEUAQ Today = Quote Start Date + 46 Days		Admin Poke = opp closed lapsed renewal alert4 sent, Opportunity Stage = Closed Lost,	
Closed Lost/Unqualified Reason = Other,		Closed Lost/Unqualified Details = Auto	
closed lapsed renewal Opportunity owner, RM, opp owner manager SAs			
For Renewal Opportunities with Exceptions Only		Email Template ID used	
Logic[Quote Date in Opportunity]	Field Update	Email Alerts Sent To Troops Alerts Sent To	
--- --- --- --- ---			
First Notification - Email Alert - 30 days prior to Late Renewal Exception Expiration Date			
00X8X000002aJxm Today = Late Renewal Exception Expiration Date - 30 Days		Admin Poke = 30 days before late renewal exception expiration Opportunity owner, RM, opp owner manager N/A	
Second Notification - Email Alert - 15 days prior to Late Renewal Exception Expiration Date			
00X8X000002aJxr Today = Late Renewal Exception Expiration Date - 15		Admin Poke = 15 days before late renewal exception expiration Opportunity owner, RM, opp owner manager N/A	
Final Notification - Email Alert + Closed Lost Update on Late Renewal Exception Expiration Date			
00X8X000002aJxw Today = Late Renewal Exception Expiration Date		Admin Poke = 0 days before late renewal exception expiration, opp closed, Opportunity Stage = Closed Lost, Closed Lost/Unqualified Reason = Other, Closed Lost/Unqualified Details = Auto closed lapsed renewal	
Opportunity owner, RM, opp owner manager N/A

- OpportunityJob.cls

Opportunity New Logo Tracking (Comp/Clari)

Business Process this supports: This supports the sales compensation and forecasting processes. This process is used to identify Opportunities that should be compensated for a New Logo.

Overview: This process maintains the values on two field on the Opportunity Recrod, CompNewLogoOverridec and NewLogoOverrideClaric. As the names suggest the CompNewLogoOverridec is a field that feeds into the Compensation process and is leveraged by the compensation team in Xactly and NewLogoOverrideClaric is a corresponding field that shares similar characteristics as the Comp field but feeds directly into Clari for forecasting needs.

Account Pub Sec Type

Business Process this supports: This is the process of how the Pub Sec Type (PubSecTypec) is determined on an account. This is important in order to determine Public Sector status on the basis of account demogrpahic information instead of ownership.

Overview: The criteria that is used to determine if an account is Public Sector or not is based on the inputs listed below. Additionally if the Account needs to be over written to a Pub Sec type that is different from what the job is producing that is possible using the PubSecTypeOverridec field

- Website
- zisubindustry
- Industry
- AccountDemographicsUPACountryc

Set Lead Address on Account on Lead Conversion

Business Process this supports: This is a part of the process of how the Billing Address is determined on an Account - by stamping the lead address on the account. The Lead address is one of the layers of the data hierarchy that is used in determining where the account is.

Overview: This process catches the lead on a lead conversion and uses the lead address to stamp either a blank lead address field on the account or to populate missing information on the lead address on the account.

- If the Lead address on the account is blank and there is any info in the lead address on the conversion the lead address will be stamped into the lead address fields on the account
- If there is a partial address in the lead address fields on the account when the lead is converted and ALL of the information on the account matches the corresponding info on the lead
- any additional new address information will be stamped into the currently blank field on the account. If the overlapping information between the account and lead is different then no new information is stamped onto the account even if there is a partial match (Example same state but different Zip Code)

Set Billing Address on Account

Business Process this supports: This is the process of how the Billing Address is determined on an Account.

Overview: The Billing Address fields on the account is determined through a hierarchy of data that is brought in from several sources. Going through the hierarchy (from first to last), if there is any field in the set of fields that has any data in it then it is used to automatically set the Billing Address on the account, otherwise we look at the next set of field. Many of the fields used in the hierarchy are only visible to admins only to avoid

confusion with the field.

Related Issues:

 - SetBillingAddressOnAccounts
- AccountClassTest.cls
 - All tests that start with setBillingAddressOnAccounts
 - validateBillingAddress (Helper Functions)

Stamp Segments based on Opportunity Owner

Business Process this supports- The sales cycle and analytics

Overview -

This automation stamps User/Owner Segment fields (Segment, Geo, Area, Role Type, Region) in the opportunity record every time when an opportunity is created or transferred to a different owner except for openprise hybrid users.

Fields that are stamped by automation -

Stamped Opp Owner User Segment

Stamped Opp Owner User Geo

Stamped Opp Owner User Region

Stamped Opp Owner User Area

Stamped Opp Owner User Role Type

Logic -

- When an opportunity is created, the automation stamps the fields depending on user's profile attributes
- When Stamped fields edited by OP is checked, the flow will not run. Preventing the field updates regardless of when an opportunity owner is changed.

Logic Locations

Flow

Changes to Net ARR formula logic

Business Process this supports- Net ARR for renewal opportunities with new business quotes, lookup value from comp table

Overview -

Net ARR formula(ARRNetc) in opportunity is calculated based on stage 1 Net ARR(Stage1XDRNetARRc) in stage 1 if there is no quote. If the opportunity is a renewal opportunity related to a primary quote of type New Subscription, Net ARR is driven by Primary quote's MRR(zquPreviewedDeltaMRRc from Zuora Quote) 12) - Opportunity ARR Basis(ARRBasisc from Opportunity). For all other use cases, existing logic in Net ARR field prevails

Fields that are stamped by automation -

NetARRAutomationc
ARRNetc(formula field driven by automation)

Logic -

- TFOpportunityAfterCreateUpdateNetARRAutomation flow is fired when an opportunity is created or updated and has a primary quote of type new subscription. If there is no primary quote of type subscription, stage 1 XDR net arr is stamped to Net arr automation field which in turn will reach the Net arr formula field
- TFOpportunityAfterUpdateStampNetARRAutomation fires only on opportunity update and checks whether StampedARRBasisc is changed. If so, the flow calculates the net arr automation field(based on primary quote's zquPreviewedDeltaMRRc or stage 1 xdr net arr if there is no primary quote). Right value is stamped to Net arr automation field which in turn will reach the Net arr formula field
- TFQuoteAfterCreateUpdateStampNetARRAutomation flow is written from a quote perspective. When a primary quote of type new subscription is created or updated, flow checks whether the opportunity satisfies 4349 and then stamps Net arr automation field which in turn will reach the Net arr formula field
- TFOpportunityAfterUpdateSyncStage1NetARR flow fires on opportunity update and populates stage 1 net arr with right net arr formula value

Changes to existing net arr formula field : Two additional layers are added. Layer 1 -> To check if stage 1 xdr net arr drives net arr when no quote is present & opp is in stage 1. Layer 2 -> To check if the opportunity is a renewal opportunity, without net arr override and has a primary quote of type subscription. If so, net arr formula field is driven by net arr automation. For all other scenarios, existing formula logic works

Opportunity Product

Please see the dedicated Opportunity Product

SECTION: sales/field-operations/sales-systems/gtm-technical-documentation/incent.md

How to use this documentation

The Documentation below is organized to understand the flow of the data from Salesforce through Xactly Connect and into Xactly Incent.

What's What

- Salesforce is one of our primary source system of data that is used to ingest information about our users, accounts, opportunities and more into Xactly in order to compensate them
- Xactly Connect is part of Xactly that Xactly Administrators and Developers can work in to organize the flow of data from Salesforce into Xactly Incent.
- Xactly Incent is where end users can monitor their compensation. The final output of Xactly Connect, alongside compensation plans and more as built out by the compensation team, is what feeds Xactly Incent

Xactly Connect

- Documentation for Xactly Connect is only accessible to users who are logged into Xactly and is accessible through the community portal
- Key Terms
 - Assets - This is the smallest action that can be taken in Xactly. It can be as simple as setting a variable to querying all of our source data.
 - Pipelines - Pipeline are a series of Assets, Emails and more that run our entire ETL process from our Salesforce source data to when it's finally loaded into Incent
- Key Pipelines
 - puploadprocessSALES - This pipeline handels the ETL for Opportunities and the users that are paid off of the Splits on the Opportunities with the exception of SDRs (See puploadprocessLGSAOM)
 - puploadprocessLGSAOM - This pipeline mainly handels the ETL for Opportunities and Events that SDRs are comensation on
 - pshareduploadorders - More info pending
- Piepline Structure
 - Pipelines may share or may not share assets. So it is important to review in oder to avoid any unnecessary consequences. Additionally it may be important to update a similar query in multiple locations so that it is reflected in all areas of incent.

Piepline Insights & Key Components

- puploadprocessSALES
 - psetdynamicvariables
 - ploadsourcedataSALES - Inserts data into the delta.sfdcSALESACCDump table and the sfcdcSALESOPPDump table
 - ptransformSALES - Transforms and migrates data from the SFDC dump tables into delta.SALESorders table, then from there into delta.prestageorderitem table and delta.prestageorderitemassignment table
 - pshareddeletetestagingtables
 - pordervalidationsSALES - Runs a number of validations on the infromation. Ex ensure that there isn't an opportunity with the same Id being loaded twice. And uploads the data to our

staging tables where there were no validation errors encountered

- pshareduploadorders
- puploadprocessLGSAOM
- psetdynamicvariables - Inserts data into the following tables: delta.sfdcLGSAOMOPPDump, delta.sfdcLGSAOMUSRdump, delta.sfdcLGSAOMOPPTMDump, delta.sfdcLGSAOMEVENTdump
- ploadsourcedataLGSAOM - Transforms and migrates data into the following tables: delta.transgenSAO, delta.prestageorderitem, delta.transgenMeetings, delta.prestageorderitemassignment from either sfdcDump tables or tables that are created in this pipeline
- ptransformLGSAOM
- pshareddeletestagingtables
- pordervalidationsLGSAOM - Runs a number of validations on the information. Ex ensure that there isn't an opportunity with the same Id being loaded twice. And uploads the data to our staging tables where there were no validation errors encountered
- pshareduploadorders
- pshareduploadorders - More info pending

How to use this documentation

Below is a Data Dictionary and Technical Documentation for our ARR Booking Metrics fields put into place for FY22.

Field Data Dictionary

ARR fields

Field	Definition	SFDC API	Replaces
Net ARR	The net change to ARR of an opportunity	ARRNetc	iACV
ARR Basis	Current Subscription ARR (Renewals Only)	ARRBasisc	Renewal ACV
Booked ARR	Total ARR of Deal (Net ARR + ARR Basis)	ARRc	ACV

Amount and Time fields

Field	Definition	SFDC
API		
Amount	The total dollars charged on the Opp (All Kinds)	Amount
Recurring Amount	All Recurring dollars (GitLab Seats, Storage)	
RecurringAmountc		
True Up Amount	All One-time True Up dollars	

TrueUpAmountc		
Pro Serv Amount		All Professional Services Dollars
ProServAmountc		
Other Non-Recurring Amount		All other one-time fee products (Additional compute minutes)
OtherNonRecurringAmountc		
Subscription Start Date		The Start Date of the period for the opportunity
StartDatec		
Subscription End Date		The End Date of the period for the opportunity
EndDateC		

Technical Documentation

Booking Metrics Fields From Quote

Business Process this supports: ARR

Overview: The goal of this code is populate the Bookings Metrics field on the Opportunity based on data from the Zuora Quote family of objects. If Zuora data is not present then use an estimated Net ARR amount until the deal is quoted. Here is where an Opp will get it's metric data:

Opportunity Status		Net ARR Source	
-----		-----	
Sales Assisted - Quoted		Zuora Quote Data	
Sales Assisted - Not Quoted		Estimated Net ARR	
Web Directs (Current)		Estimated Net ARR -> EOM Manual Process	
Web Directs (Future)		Zuora Quote Data	

Inputs: Zuora Quote Data, Opportunity Term and Amount (If manually morecasted without a quote)

Outputs: Populated Net ARR, Amount, Recurring Amount, True Up Amount, ProServ Amount, Other Non-recurring Amounts and Date fields on the related Opportunity.

Logic Locations:

- ZuoraQuoteClass.cls
- ZuoraQuoteTrigger.trigger

Code Units:

- stampOpp

Tests:

- ZuoraQuoteTest.cls

ARR Basis from related Subscription for Renewals

Business Process this supports: ARR

Overview: We receive Zuora Subscription data via the stock Zuora 360 Sync. We then use this data to create renewals, tying renewals to their related subscription, or if the Subscription receives a change in ARR, update the related Renewal with that ARR in its basis. The end result is that all of our subscriptions should have a renewal opportunity, and that opportunity's renewal basis is equal to the subscriptions current ARR (until the opp closes).

Because Zuora Subscriptions in Salesforce do not persist when their version increments, we have created a "wrapper" object called the Customer Subscription that allows the concept of a subscription to persist through changes.

Inputs: Zuora Subscription Data from Zuora 360 sync.

Outputs: Renewal Opportunities, up to date ARR Basis on Renewal Opportunities.

Logic Locations:

- ZuoraSubscriptionClass.cls
- ZuoraSubscriptionTrigger.trigger
- CustomerSubscriptionClass.cls
- CustomerSubscriptionTrigger.trigger

Code Units:

- CustomerSubscriptionClass.createRenewalOpportunity
- ZuoraSubscriptionClass.createOrUpdateCustomerSubscription

Tests:

- ZuoraSubscriptionClassTests.cls
- CustomerSubscriptionClassTests.cls

SECTION: sales/field-operations/sales-systems/license-usage-app/index.md

How to Use License Utilization Salesforce App

1. Navigate to any customer account in Salesforce.
1. Click on the License Utilization button at the top of the layout.
1. Review the current usage of Billable vs Entitled users on all Subscriptions related to the Account.
1. To get a summary of License Utilization across all your accounts click "See License Utilization on all my Accounts"
1. To give feedback or ideas for the License Utilization app click "Give Feedback / Report Bug" and comment on the issue.

Which Customers Does this Apply To?

Usage Data will be present in the License Utilization App in the following scenarios (assuming the sync is working as intended in each scenario):

1. The Customer is on Cloud Licensing.
1. The Customer is NOT on Cloud Licensing, but is on GitLab version 14.1+ and has Operational Metrics enabled.
1. The Customer is on Offline Cloud Licensing.

Frequently Asked Questions (FAQ)

Question: Billable Users is great, but when will I be able to see SMAU and other activity metrics?

Answer: The Product and Data teams are working to get these metrics at the subscription level, and when they do we will add to this dash! Follow the progress here (GitLab internal only).

Question: I viewed one of my Accounts, and some of the Subscription Data says "Not Available", what went wrong?

Answer: Billable User data is not yet available for some subscriptions based on the customer needing to send data (opted into Service Ping or is sending data via Cloud License) and be on version 14.1+. Some subscriptions will never receive their Billable User count because of air gapped hosting. In either scenario please post on the Feedback issue if you think the customer's subscription data should be available.

Question: I expected there to be more (or less) Subscriptions related to the Account then was is appearing, why is this?

Answer: Please confirm in the Sales-Support slack room if you think viewing the app uncovered and issue with the customer's Subscriptions.

Data Definitions

Data Point	Description	Source
-----	-----	-----
Plan Name	Subscription GitLab Tier	Zuora 360
Hosting Type	GitLab.com vs Self Managed	Data Team
Licensed Users	Quantity of licenses sold	Zuora 360
Billable Users	Quantity of users who count toward being billed	Service Ping
Seat Price	MAX of Seat Price	Zuora 360
Overage Value	If Over: (Billable - Licensed) x Seat Price	Calculated
Subscription Start Date	Subscription Term Start	Zuora 360
Subscription End Date	Subscription Term End	Zuora 360
Reported Date	Date we last received billable user data	Service Ping

How Does This Work?

First, product usage data is uploaded into Salesforce as a .csv file attachment to a License Utilization Run record. When triggered, the Run calls classes which read the .csv and inserts License Utilization records. Each of these License Utilization records know which Zuora Subscription it relates to and through this, which Customer Subscription as well. Then, we run a process which collects information from License Usage and Zuora Subscription Product Charge records and stamps the related Customer Subscription. On each Account record page, a button has been added which brings you to another page. This page displays all Active Customer Subscriptions related to that Account that entitle the customer to licenses.

Logic Locations

- LicenseUsageRun.trigger
 - Listens for the "Execute Run" checkbox to change values to begin the process of inserting new License Utilization records.
- LicenseUsageBatcher.cls
 - Called from LicenseUsageRun.trigger. Used to break up the insertion of License Utilization records into batches.
- LicenseUsageCollector.cls
 - Converts the rows of the .csv file into License Utilization records and returns them so they can be inserted.
- CustomerSubscriptionInfoGatherer.cls
 - Collects information from the most up-to-date License Utilization records as well as Subscription Product Charges in batches. It stamps the info onto each related Customer Subscription. This class also does some basic data processing such as determining if there are multiple products and calculating total entitled seat count. This is done to make displaying this data simpler for LicenseUsage.cls.
- LicenseUsage.cls
 - The controller for LicenseUsage.page. Collects only the Customer Subscriptions related to the Account. Ensures the data will properly display the Seat Usage graph.
- LicenseUsage.page
 - The page you are brought to by the button on the Account page. Displays all Customer Subscriptions with collected License Utilization data.

SECTION: sales/gainsight/_index.md

What is Gainsight?

Gainsight is a tool for Customer Success Managers, Renewal Managers, Account Executives, and Solutions Architects to manage the ongoing customer lifecycle.

Key Benefits of Gainsight

Gainsight will help across several different areas of the customer's lifecycle. Some highlights include:

- Efficiency: consolidated account views (Book of Business, account), product analytics,

Zendesk integration, notes, collab projects, and to-dos

- Consistency: Establish customer lifecycle process, manage and track engagement
- Visibility: health scores, risk, adoption, and data visuals
- Automation: process, adoption, enablement for digital journey
- Metrics and Analytics: Stage Adoption, customer health, time-to-value, product usage data
- Grow Net Retention: Success plan-driven engagement, expand plays

Getting Started

There are two ways to access Gainsight: through Salesforce (strongly recommended), and by logging in directly.

Access through Salesforce

Salesforce is the recommended way of accessing Gainsight, since you will have access to the full set of account information, including opportunities, subscription information, and activity.

Log in to Salesforce, and click on the "Gainsight NXT" tab at the top of the screen. If you don't see "Gainsight NXT" as a choice, you can add it by clicking the "+" sign, choosing "Customize My Tabs" and choosing Gainsight NXT from the applications list.

To hide the Salesforce header to maximize Gainsight screen space, click the "double arrow" icon in the top right corner of the Gainsight header, next to your profile icon.

If you are logging in through Salesforce, you can also quickly open the Salesforce link for the Gainsight account you're on by clicking the three vertical dots at the top right of the Gainsight account page (below your user image) then clicking "View Account".

Logging in Directly

Note: you may log in directly via Okta but you will not have subscription data, opportunity, or Salesforce activity.

To access Gainsight directly, go to gitlab.gainsightcloud.com and when prompted for your username and password, enter only your GitLab email address. As soon as it is entered, the screen should change to indicate that you are using single sign-on, and when you click "log in" it will redirect you to Okta.

Not able to log in? Here is how you can get help:

- If you need to request access to Gainsight, fill out an Access Request and have your manager add the manager approved label.
- For any Gainsight-related access questions, ping the Gainsight Admin team on the gainsight-users Slack channel.

Confirm your timezone

Your timezone is dependent on your timezone in Salesforce, so even if you change it in Gainsight, if it's incorrect in Salesforce it will be overwritten the next day. To update your

timezone in Salesforce (which is automatically PST), click your name at the top right, click "My Settings", click "Personal" on the left sidebar, click "Language & Time Zone", choose your correct timezone, and save. You will see the correct timezone in Gainsight the following day. Salesforce's timezone will automatically be PST, so you'll want to update this to your timezone to make it easier for logging events (when logging an event, it will input the current time in your selected timezone).

Configure your notifications

To adjust your individual notifications, click on your name in the upper right corner, select "My Settings", then "Notifications" at the top middle. The below pictures show the default, and you will have the following options to select based on your preferences. View Gainsight's documentation for more information.

Feedback about Gainsight

Feature Requests

New feature requests can be submitted by creating an issue and selecting the Gainsight Request template in the Customer Success Operations project. Make sure the gainsight label, and optionally the gainsight::featurerequest, gainsight::enhancementrequest, or gainsight::bug labels, are successfully applied when opening the issue. The status of all Gainsight-related issues can be viewed on the Gainsight issue board.

To request new email templates be added to Gainsight, open an issue in the Customer Success Operations project and apply the program request or new program template if relevant. If you have connected with one of the team members prior to opening the issue, please go ahead and @ mention them on the request. Otherwise, we will review all asks periodically and, if accepted, assign to one of the upcoming milestones depending on workload.

To view recent updates to Gainsight, view the running changelog.

Support tickets

To submit a support ticket about Gainsight, you have two options.

1. Email support@gainsight.com and cc the GitLab Gainsight Admin team. Optionally, you can cc the Gainsight CSM.
1. Go to the Gainsight support website, choose Gainsight NXT, and fill out the required fields.

Common errors & troubleshooting

Query API invalid response

If you receive the error message "Query API invalid response", try clearing your browser cache and cookies. We recommend also checking in a private browser (Incognito Mode, etc.) to verify

it's a browser configuration issue.

Success plan objectives updated failed

If you receive the error message "SUCCESSPLANOBJECTIVESUPDATEDFAILED" when changing the status of a Success Plan or an Account Plan from Draft to Active, it could be because there is one or more CTAs with a due date earlier than one of its tasks' due date. To correct this, re-apply the due date on tasks which will update the CTA's due date, and then try to change the Success Plan to Active again.

Account says "TO BE DELETED NO LONGER IN SFDC"

This is because two SFDC accounts were merged into one. What happens is this:

1. Salesforce has 2 records of the same account
1. SAE/or someone asks SalesOps/Deal Desk to merge
1. The two Salesforce accounts are merged
1. Gainsight does not "merge" because they were already merged in Salesforce
1. Gainsight recognizes one was deleted and marks it with the "TO BE DELETED" title for CS Ops to review and/or delete it
1. The remaining (merged) one in Salesforce remains synced to Gainsight

Error "Timeline: Invalid authentication credentials. Authentication failed" (Chrome users only)

Usually, this type of error occurs if the Chrome extension version is out of date. Try updating the Chrome extension to the latest version. It should automatically refresh and begin working, but try logging out and back in if it doesn't resolve right away.

If this doesn't solve the issue, reach out to Gainsight support and let them know you've already tried updating the extension and logging out and back in.

Role Specific Gainsight Usage

- You can find more information about how Sales uses Gainsight on the Using Gainsight within Sales page.
- You can find more information about how Customer Success Managers use Gainsight on the Using Gainsight for CSMs page.

SECTION: sales/gainsight/account-planning.md

For an overview of Gainsight, and information about how to login, please refer to the Gainsight Overview Page.

Gainsight in Salesforce

There are a few different ways to access Gainsight. The first is to access Gainsight through Okta. The second and third options require you to login to Salesforce. Once logged into

Salesforce, navigate to the Account or Opportunity page, and scroll down to the Gainsight widget. The Customer 360 page will be the default view and is customized to show high-level account data and navigational tabs specific to Account Planning. The other option, is to select the + sign on the blue navigation bar in Salesforce, and choose Gainsight NXT from the dropdown menu. Many reps prefer this view since you can see more of the entire account plan in a single pane.

Creating an Account Plan

1. From the Gainsight widget, use the top navigation bar to select the Success Plan tab.
1. In the right corner select New Success Plan.
1. Name your success plan indicating Land or Expand and year(s).
1. The Type will be Account Planning.
1. Add a due date. The account renewal date is a good place to start, although this will evolve as the plan evolves.
1. Add a template to the Account Plan by using the ellipsis menu located in the gray bar on the right side of the page. The Land Plan and Expand Plan templates will provide a guided action items and next steps.
1. To learn about other plan types (Opportunity Plan, Command Plan, Success Plan), review this page.

Locating an Existing Account Plan

1. From the Gainsight widget, use the top navigation bar to select the Success Plan tab.
1. In the gray bar towards the top of the widget, use the More Plans arrow to view the existing plans.

Account Plan Info

1. The default view of an Account Plan will be the Plan Info section.
1. Plan Info is comprised of the Customer Profile, Execution Plan and Go-To-Market Plan.
1. Add or edit content to the Plan Info by using the pencil icon located to the right of each text box.
1. For further detail on the methodology behind the individual components, [click here](#).

The Customer Profile

This section of the account plan serves to capture any relevant customer information.

Field Name	Field Description

Name	Pulled from Salesforce
Account Rank	Pulled from Salesforce

| Account Rank Notes | Link a GoogleDoc, or add any context detailing why the account was ranked the way it was. We should be starting with Rank 1 Accounts.

|

| Business Overview | High level overview of the organization, and any pertinent information that someone would need to know about the organization. This can include information such as key products and services, key customer business priorities, or financial challenges. |

| Industry Trends | Is there anything going on in the customer's industry? New technology or changes that impact the customer's org?

|

The Account Snapshot

This section of the account plan serves to capture relevant information about the customer and their engagement with GitLab.

Field Name	Field Description
Account Summary and History	Relevant information about what is currently going on in the account, and anything pertinent that could impact the account. For example, organization has a new CTO or the organization is deciding on a new cloud strategy.
Current Entitled Solutions	Information on current subscriptions, adoption rates, and product usage data if it is available.
IT/ Digital Strategy	Where is the customer in their digital transformation journey? What is their strategy for the next 3, 6, 12 months?
Strategic Partnerships	Information about partners engaged with the customer (e.g. their cloud provider) and partners involved in this account.
Goals/ Strategies/ Objectives	Information about the customer's pain, and desired positive business outcomes.
Customer High Level Initiatives	What is the customer working on? Do they have any key initiatives we should be aware of?

Go-to-Market Plan

This section of the account plan serves to capture relevant information about our plan to drive success for the customer.

Field Name	Field Description
Overall Account Plan Goals (6, 12, 18 months)	What is your vision for the customer for the next 6 months? What about 12, and 18 months? Has the customer shared their vision/ strategy for the next year with you?

GitLab Initiatives	Information about any relevant internal initiatives that could impact the customer. For example are there impending pricing changes, or incentives around GitLab Ultimate?
Threats/ Risks	Are you aware of any threats to your customer's business, to the health of their GitLab adoption, or your plans to expand within the account? For example, are they downsizing? Is Microsoft making a strong play for their CI business?
Action Plan	Based on your vision for the next 6, 12, and 18 months, how do you plan to get there? Have you considered the role of yourself, the SDR, the SA, and the CSM?

Relationship and Influence Mapping

1. From the Gainsight widget, use the top navigation bar to select the Contacts tab.
1. Use the drag and drop function to add contacts to the map or use the Add Person button located to the right of the widget.
1. Add further detail (Influence, GitLab Role, Manager) to the contact card by double clicking in the card or using the ellipsis menu.
1. Check out this article from Gainsight on building maps as well as this enablement page.

Whitespace Mapping

This activity is best done as a team, Solutions Architects and Customer Success Managers can help ensure this section reflects the team's understanding of the opportunities within the account.

1. In Gainsight, there are two different sections for whitespace mapping. Whitespace (Use Case) and Whitespace (Use Case Visual).
 - Whitespace (Use Case): This is where you will enter the data. It will flow back into Salesforce but cannot be edited in Salesforce at this time.
 - Whitespace (Use Case Visual): After data has been entered, use this tab to see a visual representation of the data. There are multiple views from which to choose.
1. Reference this Whitespace Mapping page for further detail on the methodology.

For each use case, seek to understand if the customer is using a competing technology aligned to each of the use cases (there is a picklist in Gainsight), if there is an appetite for replacement (green indicates there is an appetite for change), and when that contract ends.

Company Intelligence

Company Intelligence allows users to stay up-to-date on their key customers and prospects and can be located in the Company Intelligence tab. Company Intelligence is also available via notification. To turn on notifications follow these steps:

1. Using the bell icon in the top right corner of Gainsight, select the gear icon.
1. Select the Events drop down menu
1. Next to Company Intelligence, select your notification preferences. Currently the only option is Slack and the updates will arrive via the Gainsight Sally app.
 - Bonus: Once opted in to Slack notifications you can request additional real time updates.

Go to slack and send a direct message to "Gainsight Sally." Ask for a summary of an Account you own.

- Setting up notifications.
- Company Intelligence FAQs.
- Company Intelligence, The long version.

Note: Only 5,000 Accounts can be tracked at a time. To request an account be added to tracking, please submit an issue in the Sales Ops project and select the General Request template.

Sponsor Tracking

1. From the Gainsight widget, use the top navigation bar to select the Sponsor Tracking tab.
1. Click +Sponsor to choose a contact from the list or add a new contact by using the search feature.
1. In the action column, click the link and enter the LinkedIn URL to start tracking.
1. Private, Premium LinkedIn profiles can't be tracked at this time (May 2021).
 - Profile with special characters cannot be tracked unless a request is submitted to Gainsight Customer Support.
1. For more detail on how Sponsor Tracking works, please read this article from Gainsight.

Welcome to the High Velocity Sales and First Orders Handbook

{{% alert color="success" %}}

The High Velocity Sales and First Orders Team is responsible for delivering a cohesive go-to-

market (GTM) that enables customers and prospects to self-serve: from discovery and adoption, purchasing, expanding, and managing their GitLab subscription.

{{% /alert %}}

High Velocity Sales and First Orders Vision

GitLab engages with customers on their terms, offering seamless self-service options. We deliver a best in class self-service experience for discovering & adopting GitLab, purchasing, expanding and managing your GitLab subscription.

We are easy to do business with. Our customers get time back to do what matters most - use GitLab to build the best software possible. And our customer-facing teams get time back to focus on higher value customer interactions, allowing us to accelerate and scale our growth.

We are a showcase of GitLab's culture. Interacting with us is flexible, asynchronous enabled and transparent.

Our Strategy

This section contains forward-looking content and may not accurately reflect current-state or planned feature sets or capabilities.

1. Accelerate ARR

- Align AEs to highest ARR uplift: Adjust go-to-market and incentives to focus AEs on highest value interactions for the customer. Enhance self-service options for simple, fast interactions and build customer awareness.
- Discover new customer insights: Buying cycles are changing, a large majority start before an AE engages. Allow self discovery and monitor through product analytics to create (very) qualified leads.
- Become a tool for direct sales: GitLab operates in a self-service hybrid model. Provide customer visibility to AEs to enhance their selling conversations.
- Align our self-service GTM motion: Work jointly across Sales, Product, Marketing, Customer Success & Channels to create definition of success, leverage best technology, build a joint roadmap and deliver best experience.

2. Deliver a best-in-class Self-Service experience

- Understand our customers: Use product analytics and customer conversations to understand personas & buying journeys by segment. Define ideal seamless omnichannel experience for our customers.
- "Always on" customer feedback: Collect and summarize customer feedback into a single view. Quantify feedback to prioritize product & go-to-market changes. (e.g., Top 5 requested self-service feature based on customer survey)
- Flexible self-service engagement models: Introduce chat for on-demand support that customers can access in-context. While also creating rich feedback for our product and go-to-market teams.
- Product & Data Analytics: Without human interaction, product analytics will be our window into customer interactions. It is foundational to self-service. It will influence the product roadmap, drive interactions and identify issues.

3. Improve go-to-market efficiency, accelerate growth

- Self-Service go-to-market models: Introduce a self-service segment. Leverage an inbound 'on-demand' account team to help customers and feed our backlog. Grow the self-service channel full stack.
- Self-Service marketing campaigns: Leverage self-service product analytics to drive high performing marketing campaigns based on specific customer insights. (e.g., abandoned cart campaigns, personalized marketing automation, featured products)
- Increase Rep productivity: Increase self-service adoption in territory. Minimizing time spent on account management, operational tasks and simple transactions. Introduce new customer engagement models to connect with sales. (e.g., hand raise for sales conversation, schedule a time with a sales rep)

Success Metrics

- First Orders: inclusive of web First Orders
- SMB nARR

Team and Working With Us

In the table below, you can find the HVS team leads who report into Allie Marconi and their associated scopes.

Name	GitLab Handle	Team Name	Team Scope
Kazem Kutob	@kkutob	Global SMB & New Logo Sales Team	The Global SMB team owns customer and prospects relationships globally of companies sized 0-250 employees. The New Logo team owns "base prospects" with a goal of delivering First Orders.
Alex Martin	@alexmartin	Product GTM	Partners to co-author and deliver a product roadmap for customer outcomes. We will orient the backlog and measure feature success based on customer value, first order count & bookings growth. We will partner with product to ensure product features and releases are launched at high quality with a distribution plan delivering customer value.
Max Fliesher	@mfleisher	Data & Operations	Supports the broader HVS team given an emphasis on high velocity, data drives our strategy. Owns the end to end operational model to enable coverage with a ~1,500 customer : SMB Advocate Ratio. Owns Renewals Teams and NLT ops especially where there's crossover with SMB. Responsible for the launch, enablement and performance evaluation of cases.
Mitchell Hanks	@mhanks	Monetization & Startups	Responsible for the activating of our Free & Trial customers by targeting CE/EE and trial conversion in the "Base Account" population. Additionally responsible for the Startup Program, which enables seed and early state startup companies to get started and grow with GitLab.

Welcome to the HVS-FO Data and Ops Team Handbook

{{% alert color="success" %}}

The HVS-FO Data and Ops Team is responsible for leveraging data to optimize for the self-service customer experience and drive nARR growth via sales efficiency. Data insights from this team feed: sales visibility, self-service fulfillment features, and growth/marketing experiments. The HVS-FO Data and Ops Team also aims to create data tools to help with efficiency, prioritization, and decision making.

{{% /alert %}}

Team

Name	GitLab Handle	Title
Max Fleisher	@mfleisher	Sr. Mgr, HVS Data and Operations
Sara Gladchun	@sglad	Sr. Analyst, HVS Data
Ed Lu	@eclu94	Sr. Analyst, HVS Operations

Who We Work With

HVS-FO Team - We partner with the overall HVS-FO team to provide data insight and operational support to drive nARR and growth through sales efficiency and strategy.

Central Data Team - We work with the central data team by staying involved in cross functional data initiatives, collaborating where possible, and providing feedback on data models and the data that live in Snowflake. We also work with the data science team by staying up to date on their projects and models and incorporate many of their predictive outputs into our analyses and triggers,

Product Analytics - We work with product analytics by staying up to date on what major projects they are working on and by leveraging many of their models in our own data work.

Fulfillment - We work with fulfillment to provide data around self service fulfillment features and feature requests.

Marketing Analytics - We partner with Marketing Analytics to provide data around FO Funnels as well as targeted digital outreach to the Pooled Account customers.

Working with us

Purpose: Outline how the broader Self-Service team can engage the Self-Service Data Squad (Max, Sara)

Goal: Minimize dependencies/blockers to insights while providing transparent engagement model

Disclaimer: Not all data questions will be able to be answered. Ultimately, taking time to answer ad-hoc questions means less time on projects (aka the zero-sum capacity problem). That is not to say that ad-hoc questions are not important; however, we do have "boulder" level projects in flight have been prioritized via the OKR proc
