

ess, which we also need to make progress on.

How to submit your ad-hoc data request or question:

1. Have you tried to answer this question leveraging existing resources (e.g. data hub, SFDC)?

- If no, please try to answer your question using these existing resources.
- If yes, but you're still unable to answer your question, go to question 2.

2. Using the Data Question Intake issue template in our project, please:

- Fill out all items under the "Filled out by Requestor" section
- Add the "Self-Service Data" and "Self-Service Data Ad Hoc" labels
- If business stopping: tag Max in Slack (ideally in hvs) with link to issue.

<!-- How we prioritize ad hoc requests

The more points the better!

1. Can this question be incorporated into existing OKR? If yes, +3
2. Ease of ability to answer question (+0 = 8+ hours; +1 = 4-8 hours; +2 = 2-3 hours; +3 = 1 hour or less)
3. Priority (High = +3, Medium = +2, Low = +1)
4. Is an c-suite member asking for this? If yes, +2

If an ad-hoc request scores north of 7 points, we will re-consider prioritizing it above existing OKR work. -->

## SSOT Queries

SSOT data is necessary in order to have confidence in our metrics, have repeatable and replicable reporting, and for our data team to work more efficiently. We have created a GitLab repo to house our SSOT SQL queries for both our foundational base queries and for ad hoc analyses.

This allows us to keep a record of queries used for foundational projects like our dashboards and for one off analyses that may need to be repeated, tweaked, or modified in the future. Dashboard queries are also housed in Sisense as snippets in order for the data team to work more efficiently within the BI tool. We are currently updating these queries to work within Tableau as well.

The current workflow for creating or updating snippets and SSOT queries is the following:

1. Create or update the query and ensure it produces the desired results and accurate data
2. Update the query in the SSOT Queries directory and commit to a new branch
3. Create an MR and tag another Data Team member as a reviewer
4. The reviewer will review the code and merge the MR to update the query
5. Once MR is approved and merged, the original author will either update the snippet in Sisense (original author must also update the date in the comments with the most recent date updated)

## Tableau Data Source Workflow (WIP - New Data Source):

1. Create query using Snowflake worksheet to produce desired output
2. Create new Data Source in Tableau Desktop from Snowflake
3. Copy query into SSOT Repo to save work and track changes
4. Copy query as Custom SQL into Tableau and set to Extract
5. Run Extract and check data integrity and accuracy
6. Commit any necessary changes to the Repo
7. Once the query is finalized:
  - Publish Data Source to Server
  - CRITICAL - Data Source must be published to the Development -> Sales -> SAFE folder
  - Embed Snowflake credentials to allow for refresh

## Updating a published Tableau Data Source:

1. Log into Tableau Server
2. Locate the Data Source in My Content or in the folder above
3. Select Edit Data Source
4. Use Snowflake worksheet to test any changes to the stored query
5. Commit changes to the Repo
6. Copy new query into the Data Source Custom SQL
7. Run the extract
8. Publish the updated Data Source

---

## SECTION: sales/high-velocity-sales-fo-team/hvs\_product\_gtm.md

<link rel="stylesheet" type="text/css" href="/stylesheets/biztech.css" />

## Welcome to the HVS-FO Product GTM Team Handbook

{{% alert color="success" %}}

The HVS-FO Product GTM is the glue between product and field teams. We are a cohesive voice representing sales interests to product teams. We partner with product teams to deliver functionality that will improve the customer experience resulting in: FOs, nARR, and informed field teams that are aware of the impact.

{{% /alert %}}

## Team

|               |               |
|---------------|---------------|
| Name          | GitLab Handle |
| :-----        | :-----        |
| Alex Martin   | @alexmartin   |
| Gurmees Sodhi | @Gsodhi       |

## Mission

What is our problem space? What is the mountain we are trying to climb?

- GitLab has established a company strategy that aligns the organization to deliver 3 objectives with associates measures.
- However, individual teams have yet to determine how to operationalize this plan and continue to push forward their own efforts they believe contribute to these measures.
- This is acutely felt between sales and product teams who want to achieve FO goals but have different perspectives of what will contribute to that.

## Vision

What is our vision for this team? What does it look like at the top of the mountain?

- We will partner to co-author and deliver a product roadmap for customer outcomes. We will orient the backlog and measure feature success based on customer value, FO count & bookings growth.
- We will partner with product to ensure product features and releases are launched at high quality with a distribution plan delivering customer value.

## Strategy

How will we achieve our vision? What is our route up the mountain?

See detailed plans.

1. Joint Roadmap Development: develop prioritized list of problems/features to feed a joint roadmap.
2. Joint Roadmap Accountability: establish processes and metrics against which teams are held to within the joint roadmap.
3. Create Structure for Product Launches from GTM perspective: create two-way transparency into what our team is doing with product. Establish a GTM framework for approaches launches that serves as a rules of engagement / playbook of sorts.
4. Support in-flight Product Efforts driving Company Strategy Measures: act as a cohesive voice representing sales interests to product teams. Partner with product teams to deliver functionality that will improve the customer experience resulting in: FOs, nARR, and informed field teams that are aware of the impact.

## Working With Us

- Get in touch with in slack hvs
- Read our primary epic where we house our efforts
- See where we are tracking our in quarter efforts

## FAQ

| Question | Answer |

| :----- | :----- |

| How do you differentiate your workflow from PMM? | 1. Product Development Alignment: Product GTM actively partners with product teams to co-author and prioritize roadmaps based on customer outcomes and acts as the glue between field and product teams. Additionally, Product GTM establishes accountability frameworks and processes for product roadmaps, aligning to company objectives/metrics. This is not typically a place PMM plays. An example of this work: HVS

partnering with Digital Experience, Growth, and Fulfillment teams to align on joint problems, solutions, and success metrics. <br> 2. Operational Focus Over Messaging: PMM teams typically focus on product positioning, messaging, and GTM communications. The Product GTM team is focused on operationalizing product features to drive business outcomes (FO count, nARR) and ensure release account for the impact to field teams by leading with self-service-first launches/solutions instead of relying on humans to plug holes. For example: we assess how PMM communication strategies will impact the SMB business, given the different customer resourcing structure in the segment, and advocate on behalf of the sales teams to ensure communication strategies are not too burdensome to the SMB Advocates and scale to the customers. <br> | What are the functional focuses of the Product GTM team and how does that compare to what Mitchell Hanks' Monetization & Startups works on? | Product GTM: focuses on collecting sensing mechanism and field feedback to inform product problem areas, partnering with product teams to prioritize issues that support FO/nARR goals, and executing against product launches to ensure we are leading with self-service.<br> Monetization and Startups: drives the GitLab Startup Program by improving visibility, expanding to new customer cohorts, enhancing participant experiences, and developing partnership ecosystems with VCs/Accelerators. They also focus on free/trial monetization by streamlining user acquisition, optimizing conversion rates, developing sales plays, measuring campaign performance, and integrating product usage data into CRM systems for GTM visibility. |

---

## SECTION: sales/idea-to-production-demo/\_index.md

---

## SECTION: sales/idea-to-production-demo/setup.md

## Overview

This document is meant to outline a simple way of setting up an OpenShift Origin test box for demonstrating our Idea to Production demo.

## Hardware and OS Requirements

This setup is meant to work on a Linux or Mac host. Windows is not supported at this time.

In order to run the demo smoothly, you should have at least 10Gb of RAM available for the demo, and at least 4 CPU cores.

If you do not have a supported operating system, or enough machine resources, you can provision a Linux machine in the cloud to run your setup on.

Tested on:

- Digital Ocean: 16 GB RAM / 8 CPUs
- Amazon EC2: t2.xlarge

You need to have ports 8443 and 80 open to the public for TCP traffic.

## Software Requirements

In order to run the demo, you need to install Docker, the OC Client Tools, and our setup script.

### Install Docker

You will need to install Docker on your OpenShift machine if you have not installed it already.

The best way to install Docker is by going to their official installation instructions and following the install instructions for your OpenShift machine's operating system.

The installation steps should walk you through running Docker's Hello World app. There also be additional instructions on running Docker without the use of sudo, which is needed for this setup. So to recap what you should done:

- Installed the Docker prerequisites
- Installed Docker
- Started Docker
- Enabled your user to run the docker command without sudo
- Restarted or launched a new terminal to get new user permissions
- Are able to run the following without sudo

```
console
docker run hello-world
```

Once Docker is installed and running, we need to configure support for a insecure local registry:

### Insecure Local Registry on Linux

Configure the Docker daemon with an insecure registry parameter of 172.30.0.0/16

- In RHEL and Fedora, edit the /etc/sysconfig/docker file and add or uncomment the insecure registry line:

```
console
sudo vi /etc/sysconfig/docker
```

```
console
INSECUREREGISTRY='--insecure-registry 172.30.0.0/16'
```

- After editing the config, restart the Docker daemon.

```
console
```

```
sudo systemctl restart docker
```

- In Ubuntu edit `/lib/systemd/system/docker.service` and edit the `ExecStart` line:

```
console
sudo vi /lib/systemd/system/docker.service
```

```
console
ExecStart=/usr/bin/dockerd --insecure-registry 172.30.0.0/16 -H fd://
```

- After editing the config, restart the Docker daemon.

```
console
sudo systemctl daemon-reload
sudo systemctl restart docker
```

For troubleshooting these steps refer to the OpenShift cluster up docs

#### Insecure Local Registry on Mac

Once Docker is running, add an insecure registry of 172.30.0.0/16:

- From the Docker menu in the toolbar, select Preferences...
- Click on Advanced in the preferences dialog
- Under Insecure registries:, click on the + icon to add a new entry
- Enter 172.30.0.0/16 and press return
- Click on Apply and Restart

For troubleshooting these steps refer to the OpenShift cluster up docs

On the Mac you will also need to make sure you have enabled Docker to access enough CPU and RAM resources.

This can be done from the Preferences windows, and you need at least 4 CPUs and 10GB of RAM.

#### Install the OC Client Tools

The OC client tools are released with OpenShift Origin and are located on Origin's [GitHub Releases Page](#)

We will be running the Demo using the latest stable release of OpenShift Origin. Currently 1.3.2

To install the tools, run the following from a terminal on the OpenShift host machine:

1. In a new directory, download and extract the tools:

- Linux:

```
console
curl -L https://github.com/openshift/origin/releases/download/v1.3.2/openshift-origin-
client-tools-v1.3.2-ac1d579-linux-64bit.tar.gz | tar -xz
```

- Mac:

```
console
curl -L -O https://github.com/openshift/origin/releases/download/v1.3.2/openshift-origin-
client-tools-v1.3.2-ac1d579-mac.zip
unzip openshift-origin-client-tools
```

1. Place the tools on your path:

- Linux:

```
console
sudo cp openshift-origin-client-tools-oc /usr/local/bin/.
```

- Mac:

```
console
cd openshift-origin-client-tools-
sudo chflags nohidden /private
sudo echo pwd >> /private/etc/paths.d/origin-paths
export PATH=$(pwd):$PATH
```

1. Test that the tools are on your path:

```
console
oc version
```

Should return version output:

```
console
oc v1.3.2
kubernetes v1.3.0+52492b4
features: Basic-Auth GSSAPI Kerberos SPNEGO
```

Download and install our Setup script

This script will launch OpenShift Origin using Docker by running the cluster up script. We will use it to provision some storage, and update user permissions on the cluster to allow the demo to run.

In case you are not running our setup script, and instead already have a OpenShift cluster setup. We have outlined what the script does below so you can make similar changes to your cluster.

1. Get the setup script, in a new directory from your terminal:

- Linux:

```
console
curl -L https://gitlab.com/gitlab-org/omnibus-gitlab/repository/archive.tar.gz?ref=i2ptest
| tar -zx
```

- Mac:

```
console
curl -L -O https://gitlab.com/gitlab-org/omnibus-gitlab/repository/archive.zip?ref=i2ptest
unzip archive.zip
```

1. Place the script on your path:

- Linux:

```
console
cd omnibus-gitlab-
echo "export PATH=$(pwd)/docker/openshift/oc-cluster-wrapper:\$PATH" >> ~/.bashrc
export PATH=$(pwd)/docker/openshift/oc-cluster-wrapper:$PATH
```

- Mac:

```
console
cd omnibus-gitlab-
sudo echo $(pwd)/docker/openshift/oc-cluster-wrapper >> /private/etc/paths.d/origin-paths
export PATH=$(pwd)/docker/openshift/oc-cluster-wrapper:$PATH
```

1. Test that the script is on your path:

```
console
oc-cluster help
```

This should return a list of valid commands.

```
console
oc-cluster up [profile] [OPTIONS]
oc-cluster down
oc-cluster destroy [profile]
oc-cluster list
```

```
oc-cluster status
oc-cluster ssh
oc-cluster console
oc-cluster completion bash
oc-cluster plugin-install <plugin>
oc-cluster plugin-uninstall <plugin>
oc-cluster plugin-list
oc-cluster create-volume volumeName [size|10Gi]
[path]/root/.oc/profiles/<profile>/volumes/<volumeName>]
oc-cluster create-shared-volume project/volumeName [size|10Gi]
[path]/root/.oc/volumes/<volumeName>]
```

## Set up and Run the cluster

1. Find the public hostname and public IP you can use to access the cluster. And export them into your terminal.

If you don't have a Public DNS entry, you can use <your public ip>.xip.io

- For AWS you must use your DNS for the hostname and apps.<your public ip>.xip.io in the suffix unless you have set up a wildcarded dns
- If you are using Digital Ocean, the hostname will work with <your public ip>.xip.io and suffix with apps.<your public ip>.xip.io
- If you are running locally on you own box, the example provided should work.

```
console
export OCCLUSTERPUBLICHOSTNAME=127.0.0.1.xip.io
export OCCLUSTERROUTINGSUFFIX=apps.127.0.0.1.xip.io
```

1. Launch the Cluster:

```
console
oc-cluster up
```

1. Once it is finished it should have given you a link to the web console. If you are working on a cloud instance, this link will probably be wrong, and showing and internal IP address.

To access the console open <https://<your public hostname>:8443> in a browser tab. You will have to accept the invalid certificate.

Then login to OpenShift using username: developer password: developer

1. In your terminal, install the gitlab plugin:

```
console
oc-cluster plugin-install gitlab
```

You can read up on what happens during the plugin-install below.

This will output a link to the template you can use for the OpenShift demo. It will also output the two hostnames you will need to populate the demo with.

### Start the Demo

The output from the previous step should have given you the link to the template.

The rest of the demo process can be mostly followed from the Demo Script But you will want to use the template link provided from our setup script.

Which is: <https://gitlab.com/gitlab-org/omnibus-gitlab/raw/i2ptest/docker/openshift/idea-2-prod-template.json>

And while filling in parameters for the template, you will need to provide the two custom hostnames.

GitLab Hostname: gitlab.<your routing suffix>

Mattermost Hostname: mattermost.<your routing suffix>

Note, anywhere else in the demo script that references tanukionline.com will be replaced with you DNS name.

### Running the demo multiple times

Because you have limited storage, you will need to uninstall and re-install the gitlab-plugin each time

you want to run the demo. This involves making sure the correct values are on your path:

```
console
export OCCLUSTERPUBLICHOSTNAME=127.0.0.1.xip.io
export OCCLUSTERROUTINGSUFFIX=apps.127.0.0.1.xip.io
```

Where the values match what you used during setup.

And then running

```
console
oc-cluster plugin-uninstall gitlab
oc-cluster plugin-install gitlab
```

Restart OpenShift after the server has been restarted

Once again the environment variables need to be set:

```
console
```

```
export OCCLUSTERPUBLICHOSTNAME=127.0.0.1.xip.io
export OCCLUSTERROUTINGSUFFIX=apps.127.0.0.1.xip.io
```

Where the values match what you used during setup

And then start up the instance:

```
console
oc-cluster up
```

### GitLab Plugin Install Source

The GitLab plugin that we install to provision the storage and permissions looks like this:

```
console
Prefetch the Docker images so the demo is faster
oc import-image gitlab-ce:8.13.0 --from=docker.io/ayufan/gitlab-i2p:latest --confirm
oc import-image gitlab-ce-redis:3.2.3 --from=docker.io/redis:3.2.3-alpine --confirm
oc import-image gitlab-ce-postgresql:9.4 --from=docker.io/centos/postgresql-94-centos7:latest
--confirm
oc import-image gitlab-ce-runner:1.7.0 --from=docker.io/gitlab/gitlab-runner:alpine-v1.7.0-rc.2
--confirm
```

Allow all logged in users to use the anyuid security context  
oc adm policy add-scc-to-group anyuid system:authenticated --as=system:admin

Create 6 persistent volumes for storage  
create-volume pv-gitlab-01  
create-volume pv-gitlab-02  
create-volume pv-gitlab-03  
create-volume pv-gitlab-04  
create-volume pv-gitlab-05  
create-volume pv-gitlab-06

The create volume command used looks like:

```
console
function create-volume {
  [ $ -lt 1 ] && echo "volumename is required" && exit 1
  local profile=$(cat $OPENSIFTHOMEDIR/activeprofile)
  local volume=$1
  local size=${2:-"10Gi"}
  local path=${3:-$OPENSIFTHOMEDIR/profiles/${profile}/volumes/${volume}}

  [[ ! $size =~ ^[[:digit:]]+[GM]i$ ]] && echo "Not a valid volume size, use <number>Gi or
<number>Mi" && exit 1
```

```
oc get persistentvolume ${volume} --as=system:admin &>/dev/null && echo "The PersistentVolume already exists" && exit 1
```

Gives 777 permission to the folder, otherwise non-root cannot write on it

```
mkdir -m 777 -p $path
```

```
cat <<-EOF > /tmp/pv.yaml
apiVersion: v1
kind: PersistentVolume
metadata:
  name: ${volume}
spec:
  capacity:
    storage: ${size}
  accessModes:
    - ReadWriteOnce
    - ReadWriteMany
  persistentVolumeReclaimPolicy: Recycle
  hostPath:
    path: ${path}
EOF
```

```
oc create -f /tmp/pv.yaml --as=system:admin
rm /tmp/pv.yaml
```

```
echo "Volume created in ${path}"
}
```

The breakdown of what this is doing is as follows:

1. Pre-fetch the container images into OpenShift registry
1. Allow all logged in users to create containers running as root
  - This is done broadly specifically for the demo. So that you can create your project later. In a real setup, you would first create your project, then a service account specifically for the gitlab-ce container, and grant root only to it.
1. Create the 6 persistent volumes required for the demo
  - These particular ones are set to be hostPath mounted for the single node cluster demo
  - We use the Recycle reclaim policy to remove their directory when they are deleted

---

## SECTION: sales/manager-operating-rhythm/\_index.md

## Overview

A consistent management operating rhythm (MOR) fosters efficient, predictable growth by codifying best practices for how front-line managers in GitLab's field organization lead their teams via Planning & Execution, Talent Management, and Visibility. MORs identify key manager actions and responsibilities with guidance on how to perform, suggested cadence, standard tools

and reports, and more. Click on the links below to learn more.

- Enterprise Area Sales Manager (ASM) MOR
- Mid Market Area Sales Manager (ASM) MOR
- SMB Area Sales Manager (ASM) MOR
- Channel Sales/Account Manager (CSM/CAM) Leader MOR
- Solution Architect (SA) Manager MOR
- Customer Success Manager (CSM) Leader MOR

---

## SECTION: sales/manager-operating-rhythm/channel-sales.md

## Overview

As a complement to the Channel Sales Manager Operating Rhythm (MOR) 1-pager, the below content provides more granular guidance into how each of these responsibilities is conducted. The content has been sourced from experienced GitLab Channel Sales Leaders and is meant to serve as a guide (not hard and fast mandates) to help you manage your business and optimize results.

### Planning and Execution

#### Partner | Sales Alignment

Channel Sales leaders should meet with regional sales leaders at least twice per quarter to align on the regional partner plan. Regional plans help to ensure that the team is recruiting, maintaining, and growing the right set of Select partners to support the business based on the 4 Cs:

1. Commitment
1. Capability
1. Coverage
1. Competition

All GitLab Select partners should have an active joint business plan with GitLab and is reviewed and updated (as needed) on a quarterly basis. These joint business plans should include financial targets, new logo and growth targets, services goals, outbound marketing, training & enablement plans, and more. These plans are often referenced during weekly cadence calls.

#### Partner | Account Mapping

There should be a regular cadence (monthly to start and evolving to quarterly over time) between regional Channel & Sales leaders to align partners with top customer accounts and to discuss and agree to partner engagement strategies to land and expand within those key accounts.

#### Opportunity Reviews

Channel sales leaders should ensure that their Channel Account Managers are having regular

weekly meetings with Area Sales Managers to help ensure the right partners are engaged with open opportunities. The Channel Sales team in EMEA also holds weekly office hours to answer questions from the regional sales team, work through how to handle edge cases, and more.

### Forecasting

The VP of WW Channel Sales hosts a weekly forecast call with regional Channel Sales Directors to review and discuss details from the Channel & Alliances Dashboard including but not limited to:

- Partner sourced vs. partner co-sell pipeline & forecasts
  - For growth as well as for First Order (new) business
  - For current quarter and future quarters
- Partner coverage for new opportunities

### Team Meetings and 1x1s

Regional Channel Sales leaders typically host weekly team calls and have weekly 1x1s with direct reports. In addition, the EMEA team conducts 15-minute standup meetings twice weekly to align on priorities, identify and address obstacles, and track progress against the week's goals.

### Talent Management

#### Recruiting

Always be recruiting! As outlined in the Winning Top Talent portion of the GitLab Field Manager Development Program, the importance of effective recruiting to GitLab's continued growth and success cannot be understated. Channel Sales leaders should meet regularly with your Talent Acquisition Recruiter (exact cadence will vary based on hiring needs) and should also be comfortable and confident in selling the amazing opportunity here at GitLab.

#### Key Resources

- Success Profile
- Interview Guide
- Networking tools
- "Why GitLab" Summary

#### Onboarding

Channel Sales leaders should work with new Channel Account Managers to develop and monitor progress against a documented 30/60/90 day plan, set clear performance expectations, and provide regular feedback during the onboarding process. New CAMs should be encouraged to complete their general GitLab onboarding issue, and Channel Sales leaders should ensure that they actively participate in and complete Sales Quick Start.

#### Performance Management

Individual performance assessments are conducted on a semi-annual basis within the GitLab

Channel Sales team (mid-year review and end-of-year review).

### Developing and Retaining

Developing and retaining key talent is constantly top-of-mind for high-performing Channel Sales leaders. The best Channel Sales leaders provide regular coaching, follow Performance Management best practices, and leverage GitLab's Field Functional Competencies to reinforce the critical skills and behaviors that will lead to desired outcomes/results.

### Team Assessment

Last but not least, Channel Sales leaders also assess their teams annually following the Performance / Growth Matrix (including the identification of at-risk as well as high-potential team members), proactively identify resource needs, and define their succession plan.

### Visibility

### GTM Planning

Channel Sales leaders actively participate in annual planning discussions and provide input to inform and align partners to organization changes and/or account and territory assignments in the region and to identify and secure the proper internal and partner resources to help execute against regional business objectives.

### Quarterly Business Reviews

Every three months, Channel Sales leaders provide an update on their business. These updates include but are not limited to:

- Previous quarter's results relative to targets
- Business outlook for the coming quarter
- Assessment of strategic initiatives and resources needed with accompanying business justification
- Select Partner retention
- 4 Cs for each Select Partner
  1. Commitment
  1. Capability
  1. Coverage
  1. Competition

---

## SECTION: sales/manager-operating-rhythm/enterprise-sales.md

### Overview

Welcome to the Enterprise Area Sales Manager Handbook. You can use the Enterprise Area Sales Manager Playbook for a 1-page view of what's on this page. It includes key activities an Enterprise Area Sales Manager leads as they manage their team and area. Think of it as a guide (not hard and fast mandates) to help you manage your business and optimize results.

The below detail offers additional guidance on how responsibilities and activities are managed, and has been sourced from experienced GitLab Enterprise ASMs and leaders. When thinking about 'what good looks like' in this department, refer to your job family, the field competencies, our manager and leadership competencies, and our GitLab values.

### Quick links

- Enterprise Sales handbook page: This page is the home base for Enterprise Sales and includes links to our content hub (Highspot), training hub, slack channels, tools, strategy and planning resources. It also includes all resources for our Enterprise Accounts Executives (AEs), including major and strategic roles, like the Enterprise Account Executive playbook.
- Enterprise Sales update ticker: This is updated weekly based on focus areas and key topics for the week. Bookmark it and consistently point your team back to it.
- Sales handbook page: This page has general sales guidance applicable to all roles and segments, including deal and order processing information, customer reference resources, executive sponsorship, and more.
- Enterprise Area Sales Manager playbook: A 1-pager guide showing the typical operating rhythm that area sales managers use to run their business, manage their teams, and get results. It also includes key reports and dashboards to help you.
- Enterprise Account Executive onboarding journey: An at-a-glance view of your team member's first 90 days, and the milestones they should reach during this time.

### Strategic sales planning

Strategic sales planning is a key activity every Area Sales Manager (ASM) leads for their team

- validating that sales team members:
  - Are focused on the accounts and opportunities that have the highest potential,
  - Are aware of the things that may impact their plan positively or negatively, rooted in strong data analysis
  - Are collaborating effectively with their deal team and internal business partners like field marketing, deal desk, channel, partners & alliances
  - And have enough pipeline to reach their goals and quotas.

### Territory assignments and GTM planning

This happens annually. In preparation, you'll look at how those accounts are distributed across your team and validate our goal of having a fairly equitable distribution across your Account Executives (AEs). You'll recommend territory assignments and quotas and identifying resource requirements to meet and exceed financial targets.

### Territory planning is a key part of strategic planning

AEs create a new or updated territory plan based on their assignments annually; the detail of this plan will vary depending on if they are Major or Strategic Account Executives. They present these plans in Territory Plan Presentations hosted by ASMs or VPs, which usually occur twice per year in Q1 and Q3. View the territory planning handbook page and toolkit.

Every Account Executive in Enterprise Sales should have a territory plan for how they're approaching their patch, and every ASM should have visibility into it so they can help each AE

validate and update their approach. This plan is a high-level, strategic and collaborative plan for targeting the right customers and implementing goals for income and consistent sales growth over time. It includes planning for pipeline generation, partner/channel engagements, and field marketing activities. It's usually followed by the creation of in-depth account plans for prioritized accounts.

While this type of strategic planning is a material up-front time investment, it's incredibly helpful for an AE in better understanding their territory and is much easier to update and iterate on over time.

### Account planning

Following a territory plan, a AE has identified and prioritized the accounts they are going to focus on to reach their goals. For their top accounts, each AE should prioritize the ones they're going to create account plans for and agree with their ASM on the level of detail required. Account planning should occur quarterly, if not more frequently.

High-level account plans are often shared using a strategic account plan template, and can be stored alongside territory plans. Detail and month to month maintenance usually occurs in Gainsight in collaboration with Customer Success Managers (CSMs) for expand accounts that have a CSM assigned. CS team members and AEs can build joint success plans in Gainsight and use it to view customer product usage and health scoring.

### Reviews and consults

#### Quarterly Business Reviews (QBRs)

QBRs happen during the first two weeks of each quarter for the previous quarter. Preparation usually starts about two weeks before that. QBR decks are stored in our Google Drive (GitLab internal only).

#### Account reviews

Initially, ASMs and CSM Managers may want or need to partner on scheduling and facilitating these reviews, but regular account reviews should eventually become part of an account team's normal operating rhythm. See Coaching Account Planning for ASMs for additional guidance.

Accounts reviews are conducted quarterly (or more frequently as needed) at various points in the quarter, usually over a 2-week period. The extended account team (AEs, SA, CSM, SDR) is encouraged to participate and contribute.

Customer Success participation is critical to ensure alignment between the account plan and the customer success plan (see What is the Difference Between an Account Plan and a Success Plan?).

#### Partner Reviews

Partner reviews are used to make sure the partner plan is aligned with regional sales goals and objectives and covers questions like:

- Do we have the right set of partners to support the business?

- Where and what type of additional partners are needed and why?
- How do we drive even more alignment and collaboration between key partners and GitLab account teams?

ASMs either host or participate in these depending on who owns the activity (this looks different in different regions and sectors). It's a best practice have either a bi-weekly or monthly connect with your regional Channel & Alliances team, and support it with a plan of how you'd like to collaborate.

## Opportunity Reviews

Opportunity consults are deal reviews that focus on helping a sales team member maximize the likelihood of winning and securing the customer's business. They are based on a joint inspection of the "health" of the opportunity's Command Plan and a 2-way dialogue to identify and commit to specific actions that aim to increase the likelihood of success.

Using the Command Plan in an opportunity consult. Every key opportunity, especially for key accounts, should have a command plan associated with it. This gives the business visibility into the opportunity, how it's developing, and highlights where they can support and coach the AE on progressing it forward. Our command plan reviews follow the Command of the Message Sales Methodology, and incorporate MEDDPIC.

Identifying opportunities for a consult. During monthly forecast calls and weekly 1x1s, the ASM and each AE identify which opportunities would benefit from an opportunity consult and work together to get those scheduled. When possible, the entire account team (AE, SA, CSM, and SDR) participates in these reviews.

Run consults every week. ASMs should be conducting multiple opportunity consults every week (though not necessarily with the same AEs). Sometimes these reviews follow the standard opportunity consult format. Other times, these reviews are working sessions that include the ASM working with the AE and/or account team to collaboratively complete the Command Plan for a given opportunity. And other times, the ASM may choose to hone in on one or a few specific areas of the opportunity (this may especially be the case for follow up opportunity reviews).

Some ASMs also choose to conduct opportunity consults with a group to incorporate peer review and feedback (either during regularly scheduled team meetings or as separate meetings). Consider the below framework and iterate as you deem appropriate:

- Invite AEs to volunteer in advance to do a group consult and present their Command - Plan for a key deal to the rest of the team
- Schedule a 30-45 minute meeting once you have a volunteer
  - ASM to decide whether team participation is mandatory or optional (consider starting as optional but strongly encouraged until the value is proven)
- During the meeting, the volunteer AE presents his or her Command Plan for one key opportunity and then receives questions, input, and feedback from the team
- If successful, consider creating a recurring meeting series (1-2x per month)

## Forecasting and pipeline reviews

Find Clari and Salesforce resources for these reviews in the Enterprise Area Sales Manager

Playbook. The following forecast & pipeline review cadence is recommended:

1. Month 1 of a quarter: current fiscal quarter (CFQ)
1. Month 2 of a quarter: next fiscal quarter (Current Quarter + 1)
1. Month 3 of a quarter: two fiscal quarters out (Current Quarter + 2)

Quarterly Business Reviews (QBRs) provide a great opportunity to conduct Month 1 CFQ forecast & pipeline reviews, so you likely don't need a separate review. At the end of Month 1, the ASM should encourage AEs to clear out pipeline opportunities from the CFQ forecast. Entering Month 2, all CFQ opportunities should be in either Best Case or Commit. If they are not, the forecasted close date should be pushed out.

Month 2 and Month 3 forecast & pipeline reviews are typically scheduled for 2 hours. Ideally, the Month 2 review takes place ~30 days after the QBRs, and Month 3 reviews are scheduled about ~30 days after that (but not in the last 7-10 days of the quarter). See the Out-Quarter Forecasting and Pipeline Reviews section below for additional guidance.

In-Quarter Forecasting: Every week, ASMs must review the team's Commit & Best Case opportunities and submit their forecast. ASMs should work with their teams to ensure that the Single Source of Truth (SSOT) for Best Case and Commit deals is in Salesforce.

Out-Quarter Forecasting and Pipeline Reviews: As outlined above, out-quarter reviews typically take place in Month 2 and 3 of the quarter. Each AE has 15-20 minutes to cover the following topics:

1. Forecast
  - Summary of Stage 3+ opportunities by stage
  - Churn risks
  - Call out specific opportunities only if you want to discuss (e.g. highlight a risk, ask for help, etc.)
1. Pipeline
  - Where are you against pipeline coverage targets?
  - Plans to close gaps, highlight risks
  - Actions with partners and SDRs
1. Prioritized Actions

Best practices for forecasting and pipeline reviews

We have detailed guidance on Sales Forecasting, Opportunity Management, and using our tools to review on the internal handbook page. Guide AEs to the Clari cheat sheet and sales-support Slack channel for additional support.

- AEs should be empowered to be the CEO of their own territory and manage their business accordingly. ASMs will need to manage the agenda to ensure the team doesn't get bogged down in too much detail and encourage AEs to focus on the bigger picture. More specifically, even the best AEs will miss their quarterly quota from time to time. What's important is that the AE and ASM are aware of the risk in advance and that there is sufficient pipeline in other quarters to make up for a down quarter.
- It's not a performance review. ASMs should also continuously reinforce that the dashboards, heat map, and other resources listed below are for the AE's benefit (not management tools) and

to help them effectively manage their business.

- 3.5x is the rule of thumb for pipeline. A general rule of thumb is that a AE has 3.5x their target in pipeline (view the Prospecting handbook page for in-depth guidance). During strategic planning they should identify this number and then work backwards to determine the value they need to deliver every quarter and every month.

### Coaching team members

Coaching and mentoring happens throughout the development of your team member, as well as during business as usual activities like territory planning, account planning, sales calls, prospecting and pipeline reviews, opportunity reviews, and the list goes on and on.

Follow Performance Management best practices, and leverage GitLab's Field Functional Competencies to reinforce the critical skills and behaviors that will lead to desired outcomes/results.

ASMs should focus on providing coaching and mentoring in a collaborative and proactive way. Examples include but are not limited to:

- Reinforce effective discovery best practices
- Maintain proper focus on customer value (Command of the Message) and avoid technical rabbit holes
- Identify when and how to position GitLab's holistic differentiators to the right people at the right time
- Help newer AEs understand the context behind industry terms/concepts like application refactoring, microservices, Kubernetes, and more
- Improve the quality of Command Plans

ASMs routinely participate in sales calls with their new AEs or with AEs working on extremely complex, strategic, or high-impact deals including:

- Helping with meeting prep (see Develop a Pre-Call Plan)
- Participating on the call
- Debriefing immediately after the call

### Team assessment

Last but not least, ASMs also assess their teams annually following the Performance / Growth Matrix.

### Onboarding new team members

All team members go through an onboarding journey by segment and role. View the AE onboarding journey [here](#).. In it, AEs are assigned the following activities:

- Standard GitLab onboarding issue (1-2 weeks): AEs should complete all 'red dot' tasks in their onboarding issue, bookmark and organize key resources, and learn about the GitLab product they're going to be selling
- Customer Ready Shadow Program: Shadowing can start as soon as they take the 20-minute training in their onboarding issue.

- Sales Quickstart (async pre-work and 1 week of ): This time should be spread across their first two weeks. This covers general sales methodology, DevOps landscape, MEDDPICC, our portfolio of products, and our customers, personas, and their pain points.
- Role-based pathway (4 hours per month for first 90 days): This pathway is divided into bite-sized training they should complete during their first 90 days and guides them around key activities they should be familiar with as a AE. Things like territory planning, pipeline generation, effective discovery.

ASMs should work with new AEs to develop and monitor progress against their 30/60/90 day plan, set clear performance expectations, and provide regular feedback during the onboarding process.

#### Key activities for managers during team onboarding

- Support your ramping AE. ASMs should encourage new AEs to complete "red dot" tasks in their general GitLab onboarding issue, bookmark and organize key resources, complete their role-specific onboarding, and prioritize peer-to-peer shadowing of customers calls.
- Connect the dots. Encourage your new hires to speak up or ask for help when and if they need it. Pair them with an onboarding buddy to support their first 90 days, and point them to the right resource and team when they're not sure where to find something.
- Actively support their shadow time with peers. 100% of our new hires recommend customer call shadowing as a key way to onboard fast. Learn about the program, help them prioritize participation, and foster a culture of shadowing within your team.
- Get familiar with their onboarding journey. Every AE is required to complete role-specific training - this is the content that the majority of AEs need to know to do their everyday jobs. Without it, AEs generally don't know where to find what they need or who to go to for what.

#### Recruiting top talent

Always be recruiting! As outlined in the Winning Top Talent portion of the GitLab Field Manager Development Program, the importance of effective recruiting to GitLab's continued growth and success cannot be understated. ASMs should meet regularly with your Talent Acquisition Recruiter (exact cadence will vary based on hiring needs) and should also be comfortable and confident in selling the amazing opportunity here at GitLab.

#### Key Resources

- Success Profile
- Interview Guide
- Networking tools
- "Why GitLab" Summary

#### Career development and mobility for your team

Career development is the lifelong process of managing learning, work, leisure and transitions to move toward a personally determined and evolving preferred future. As a manager you should:

- Take time with team members to discuss their career aspirations
- Listen and provide feedback, ideas and contacts
- Make choices to support their development.

Start by encouraging them to create an Individual Growth Plan and then go over it together.

## Manager development program

Manager effectiveness is important to GitLab's continued ability to attract, develop, and retain key talent and deliver scalable, efficient growth. In response, the Corporate L&D, People, and Field Enablement teams collaborated to launch programs to equip managers with a foundational set of skills & practices for effectively managing remote teams across GitLab's field organization.

Field Manager Development Program: Managers participate in a series of quarterly training & reinforcement exercises throughout each fiscal year. While there will be formal training elements, a large focus will be on social learning (learning from others) and practical, real-world application to convert knowledge to action. Learn more on the Field Manager Development Program handbook page.

## SECTION: sales/manager-operating-rhythm/mid-market-sales.md

## Overview

Welcome to the Commercial Area Sales Manager Handbook. You can use the Global Manager Playbook for a 1-page view of core resources. The playbook includes key activities a Commercial Area Sales Manager leverages to manage their team. It is a guide (not hard and fast mandates) to help you manage your business and optimize results.

The below detail offers additional guidance on how responsibilities and activities are managed, and has been sourced from experienced GitLab Commercial ASMs and leaders. When thinking about 'what good looks like' in this department, refer to your job family, the field competencies, our manager and leadership competencies, and our GitLab values.

## Quick links

- Commercial Sales handbook page: This page is the home base for Commercial Sales and includes links to our content hub Highspot, training hub, slack channels, tools, strategy and planning resources. It also includes all resources for our Commercial Accounts Executives (AEs).
- Commercial Sales update ticker: This is updated weekly based on focus areas and key topics for the week. Bookmark it and consistently point your team back to it.
- Sales handbook page: This page has general sales guidance applicable to all roles and segments, including deal and order processing information, customer reference resources, executive sponsorship, and more.
- Global Area Sales Operating playbook: A set of slides showing the typical operating rhythm that area sales managers use to run their business, manage their teams, and get results. It also includes key reports and dashboards to help you.
- Commercial Account Executive onboarding journey: An at-a-glance view of your team member's first 90 days, and the milestones they should reach during this time.

## Strategic sales planning

Strategic sales planning is a key activity every Area Sales Manager (ASM) leads for their team

- validating that sales team members:

- Are focused on the accounts and opportunities that have the highest potential,
- Are aware of the things that may impact their plan positively or negatively, rooted in strong data analysis
- Are collaborating effectively with their deal team and internal business partners like field marketing, deal desk, channel, partners & alliances
- And have enough pipeline to reach their goals and quotas.

### Territory assignments and GTM planning

This happens annually. In preparation, you'll look at how those accounts are distributed across your team and validate our goal of having a fairly equitable distribution across your Account Executives (AEs). You'll recommend territory assignments and quotas and identifying resource requirements to meet and exceed financial targets.

### Territory planning is a key part of strategic planning

AEs create a new or updated territory plan based on their assignments annually; the detail of this plan will vary depending on if they are Major or Strategic Account Executives. They present these plans in Territory Plan Presentations hosted by ASMs or VPs, which usually occur twice per year in Q1 and Q3. View the territory planning handbook page and toolkit.

Every Account Executive in Commercial Sales should have a territory plan for how they're approaching their patch, and every ASM should have visibility into it so they can help each AE validate and update their approach. This plan is a high-level, strategic and collaborative plan for targeting the right customers and implementing goals for income and consistent sales growth over time. It includes planning for pipeline generation, partner/channel engagements, and field marketing activities. It's usually followed by the creation of in-depth account plans for prioritized accounts.

While this type of strategic planning is a material up-front time investment, it's incredibly helpful for an AE in better understanding their territory and is much easier to update and iterate on over time.

### Account planning

Following a territory plan, a AE has identified and prioritized the accounts they are going to focus on to reach their goals. For their top accounts, each AE should prioritize the ones they're going to create account plans for and agree with their ASM on the level of detail required. Account planning should occur quarterly, if not more frequently.

High-level account plans are often shared using a strategic account plan template, and can be stored alongside territory plans. Detail and month to month maintenance usually occurs in Gainsight in collaboration with Customer Success Managers (CSMs) for expand accounts that have a CSM assigned. CS team members and AEs can build joint success plans in Gainsight and use it to view customer product usage and health scoring.

### Reviews and consults

## Quarterly Business Reviews (QBRs)

QBRs happen during the first two weeks of each quarter for the previous quarter. Preparation usually starts about two weeks before that.

### Account reviews

Initially, ASMs and CSM Managers may want or need to partner on scheduling and facilitating these reviews, but regular account reviews should eventually become part of an account team's normal operating rhythm. See Customer 360 for a comprehensive overview of individual customers, consolidating vital information such as health scores, product usage, subscription & billing details, and open opportunities. Can be used alongside the Use Case Adoption page for adoption scores covering SCM, CI, CD, and security.

Accounts reviews are conducted quarterly (or more frequently as needed) at various points in the quarter, usually over a 2-week period. The extended account team (AEs, SA, CSM, SDR) is encouraged to participate and contribute.

Customer Success participation is critical to ensure alignment between the account plan and the customer success plan (see What is the Difference Between an Account Plan and a Success Plan?).

### Partner Reviews

Partner reviews are used to make sure the partner plan is aligned with regional sales goals and objectives and covers questions like:

- Do we have the right set of partners to support the business?
- Where and what type of additional partners are needed and why?
- How do we drive even more alignment and collaboration between key partners and GitLab account teams?

ASMs either host or participate in these depending on who owns the activity (this looks different in different regions and sectors). It's a best practice have either a bi-weekly or monthly connect with your regional Channel & Alliances team, and support it with a plan of how you'd like to collaborate.

### Opportunity Reviews

Opportunity consults are deal reviews that focus on helping a sales team member maximize the likelihood of winning and securing the customer's business. They are based on a joint inspection of the "health" of the opportunity's Command Plan and a 2-way dialogue to identify and commit to specific actions that aim to increase the likelihood of success.

Using the Command Plan in an opportunity consult. The Opportunity Overview section is required for ALL opportunities in stage 2-Scoping or later for current quarter and next quarter as a minimum global standard. The remaining sections (MEDDPIC and Close Plan Details) are only required for opportunities at or above defined ARR thresholds (\$100K+ for Enterprise, \$50K+ for Mid-Market). By day 1 of the current quarter, all Command Plans and Opportunity Consults should be updated for both the current and next quarters. Note: These thresholds are minimum global standards, and geographic and segment specific teams can and should aim to exceed these

expectations by extending the command plan process to lower deal thresholds where appropriate. Our command plan reviews follow the Command of the Message Sales Methodology, and incorporate MEDDPIC.

Identifying opportunities for a consult. During monthly forecast calls and weekly 1x1s, the ASM and each AE identify which opportunities would benefit from an opportunity consult and work together to get those scheduled. When possible, the entire account team (AE, SA, CSM, and RM) participates in these reviews.

Run consults every week. ASMs should be conducting multiple opportunity consults every week (though not necessarily with the same AEs). Sometimes these reviews follow the standard opportunity consult format. Other times, these reviews are working sessions that include the ASM working with the AE and/or account team to collaboratively complete the Command Plan for a given opportunity. And other times, the ASM may choose to hone in on one or a few specific areas of the opportunity (this may especially be the case for follow up opportunity reviews).

Some ASMs also choose to conduct opportunity consults with a group to incorporate peer review and feedback (either during regularly scheduled team meetings or as separate meetings). Consider the below framework and iterate as you deem appropriate:

- Invite AEs to volunteer in advance to do a group consult and present their Command - Plan for a key deal to the rest of the team
- Schedule a 30-45 minute meeting once you have a volunteer
  - ASM to decide whether team participation is mandatory or optional (consider starting as optional but strongly encouraged until the value is proven)
- During the meeting, the volunteer AE presents his or her Command Plan for one key opportunity and then receives questions, input, and feedback from the team
- If successful, consider creating a recurring meeting series (1-2x per month)

#### Forecasting and pipeline reviews

Find Clari and Salesforce resources for these reviews in the Global Sales Operating Manager Playbook. The following forecast & pipeline review cadence is recommended:

1. Month 1 of a quarter: current fiscal quarter (CFQ)
1. Month 2 of a quarter: next fiscal quarter (Current Quarter + 1)
1. Month 3 of a quarter: two fiscal quarters out (Current Quarter + 2)

Quarterly Business Reviews (QBRs) provide a great opportunity to conduct Month 1 CFQ forecast & pipeline reviews, so you likely don't need a separate review. At the end of Month 1, the ASM should encourage AEs to clear out pipeline opportunities from the CFQ forecast. Entering Month 2, all CFQ opportunities should be in either Best Case or Commit. If they are not, the forecasted close date should be pushed out.

Month 2 and Month 3 forecast & pipeline reviews are typically scheduled for 2 hours. Ideally, the Month 2 review takes place ~30 days after the QBRs, and Month 3 reviews are scheduled about ~30 days after that (but not in the last 7-10 days of the quarter). See the Out-Quarter Forecasting and Pipeline Reviews section below for additional guidance.

In-Quarter Forecasting: Every week, ASMs must review the team's Commit & Best Case

opportunities and submit their forecast. ASMs should work with their teams to ensure that the Single Source of Truth (SSOT) for Best Case and Commit deals is in Salesforce.

**Out-Quarter Forecasting and Pipeline Reviews:** As outlined above, out-quarter reviews typically take place in Month 2 and 3 of the quarter. Each AE has 15-20 minutes to cover the following topics:

1. Forecast

- Summary of Stage 3+ opportunities by stage
- Churn risks
- Call out specific opportunities only if you want to discuss (e.g. highlight a risk, ask for help, etc.)

1. Pipeline

- Where are you against pipeline coverage targets?
- Plans to close gaps, highlight risks
- Actions with partners and SDRs

1. Prioritized Actions

Best practices for forecasting and pipeline reviews

We have detailed guidance on Sales Forecasting, Opportunity Management, and using our tools to review on the internal handbook page. Guide AEs to the Clari cheat sheet and sales-support Slack channel for additional support.

- AEs should be empowered to be the CEO of their own territory and manage their business accordingly. ASMs will need to manage the agenda to ensure the team doesn't get bogged down in too much detail and encourage AEs to focus on the bigger picture. More specifically, even the best AEs will miss their quarterly quota from time to time. What's important is that the AE and ASM are aware of the risk in advance and that there is sufficient pipeline in other quarters to make up for a down quarter.

- It's not a performance review. ASMs should also continuously reinforce that the dashboards, heat map, and other resources listed below are for the AE's benefit (not management tools) and to help them effectively manage their business.

- 3.5x is the rule of thumb for pipeline. A general rule of thumb is that a AE has 3.5x their target in pipeline (view the Prospecting handbook page for in-depth guidance). During strategic planning they should identify this number and then work backwards to determine the value they need to deliver every quarter and every month.

Coaching team members

Coaching and mentoring happens throughout the development of your team member, as well as during business as usual activities like territory planning, account planning, sales calls, prospecting and pipeline reviews, opportunity reviews, and the list goes on and on.

Follow Performance Management best practices, and leverage GitLab's Field Functional Competencies to reinforce the critical skills and behaviors that will lead to desired outcomes/results.

ASMs should focus on providing coaching and mentoring in a collaborative and proactive way. Examples include but are not limited to:

- Reinforce effective discovery best practices
- Maintain proper focus on customer value (Command of the Message) and avoid technical rabbit holes
- Identify when and how to position GitLab's holistic differentiators to the right people at the right time
- Help newer AEs understand the context behind industry terms/concepts like application refactoring, microservices, Kubernetes, and more
- Improve the quality of Command Plans

ASMs routinely participate in sales calls with their new AEs or with AEs working on extremely complex, strategic, or high-impact deals including:

## The Goals of Sales Quick Start

Onboarding for Field Team Members at GitLab is a blended learning experience (virtual, self-paced learning path paired with an immersive, hands-on in-person workshop called Sales Quick Start) focused on what new field team members need to KNOW, DO, and BE ABLE TO ARTICULATE

within their first 30 days or so on the job so they are "customer conversation ready" and they are comfortable, competent, and confident leading customer engagements before the end of their first several weeks on the job. There are some formal learning components with a heavy emphasis on social learning (learning from others) and learning by doing to help bridge the knowing-going gap.

For a detailed list of SQS Learning Objectives, please visit this page.
