

(NSFW) websites.

Our concerns usually start with websites that contain lots of popups, click bait, multiple pages of celebrity photos, or are susceptible to malware. In other words, you can view your Facebook news feed, however please avoid opening any advertisements. Please visit any of these kinds of websites on your personal phone or tablet since they are much less vulnerable to malware installation.

You'll be required to read the Internal Acceptable Use Policy as part of the onboarding issue.

Please be aware that your computer is monitored by Jamf (MDM) and SentinelOne (EDR), including any URLs that you visit. This is only used for retroactive security investigations and we do not proactively monitor for your activity. In other words, it's not a "big brother" monitoring approach, it's for having as much forensic breadcrumb trail data as possible if your computer is breached. You can learn more about what data we can see in this slide deck.

SECTION: security/corporate/services/laptops/security/touchid/_index.md

Overview

Please enable Touch ID on initial setup.

We use WebAuthn for 2FA at GitLab. In other words, you will be prompted for your biometrics (Face ID/Touch ID/fingerprint) or a security key (YubiKey, etc.) on a regular basis when signing into Okta and various web applications.

- Vendor Docs - Using Touch ID on Mac
- Vendor Docs - Touch ID and Password Settings on Mac

SECTION: security/corporate/services/laptops/security/unattended/_index.md

Overview

All GitLab team members must follow the clean desk / clear screen principle and keep their computers locked when not actively being used and any sensitive GitLab information must be stored and secured when not in use when working from a shared or public space.

In other words...

- Never leave your unlocked computer unattended.
- Activate the screensaver, lock the desktop, or close the lid.
- When possible, sign out or close active web browser sessions when finished.
- If using public wireless networks, you should disable WiFi on your laptop when not in use or when traveling to avoid network traffic interception or use Nordlayer VPN.

Screen Saver and Password Lock

> No Action Required: This has been automatically configured by Jamf, however verification is recommended.

- Set up a screen saver with password lock on your laptop with a timeout of 15 minutes (or less).
- Require password after screen saver starts after 5 seconds (or less).
- Disable password hints
- Configure login window to show a list of users and not the last signed in user

Vendor Docs

SECTION: security/corporate/services/laptops/security/updates/_index.md

Overview

We believe in staying up to date with security patches on all endpoint operating systems and installed software to mitigate the risk of exploitable vulnerabilities.

What to Expect

You should plan on performing software updates for 30-60 minutes every 2-3 weeks. It is easiest to plan for this towards the end of your workday or the end of the work week so that you can save any work and close any application windows before needing to restart your laptop.

When a new macOS version is released, our Security beta testers will perform testing on the latest version to ensure the upgrade goes smoothly without any breaking changes that impact your productivity. After 1-3 weeks of testing (except for critical vulnerabilities), we use Jamf and Nudge to send desktop pop-up notifications to remind team members to update their operating system at their earliest convenience within the next few days.

Configuration Steps

You need to ensure that macOS is configured to perform automatic software updates for security patches.

All applications should regularly be checked for updates by navigating to the application name in the top left of the menu bar and choosing the About or Check for Updates option (varies by application).

If you use brew or a package manager, it can keep your software updated automatically.

- Vendor Docs - Apple MacOS
- Vendor Docs - Brew Packages
- Vendor Docs - 1Password
- Vendor Docs - Chrome
- Vendor Docs - Slack
- Vendor Docs - VS Code
- Vendor Docs - Zoom

Nudge for macOS Updates

This is a placeholder.

Third Party Software Deployment and Patching

New System Deployment

When a new macOS device completes enrollment, we automatically deploy our most commonly used applications through Installomator. This process should kickoff within five minutes of when the team member reaches their Desktop for the first time.

Process Details

1. The team member completes their initial account setup via Okta login and selected Setup Assistant panes, which include Location Services, Accessibility, Touch ID enrollment, and Light/Dark appearance selection.
1. Upon first Desktop access, Installomator should automatically launch within five minutes.
1. Installomator performs two primary functions:
 1. Installs our most commonly used applications (1Password, Google Chrome, Slack, Zoom)
 1. Optimizes the Dock configuration
1. Once Installomator finishes the installation process, the user clicks "Done" in the Installomator interface to exit.
1. The system will prompt the team member to logout, and then will initiate an automatic restart.
1. The restart completes the setup process, including prompting the team member to enable FileVault.

This automated approach ensures consistent application deployment across all newly enrolled macOS devices while minimizing manual intervention.

Jamf App Installers

Certain third party software is automatically patched by Jamf using their app installers. Periodically users will receive notifications in the top right corner of their screen to initiate an update. Users can either quit their software and reopen once complete or restart their computer in order for updates to complete. Updates typically take less than a minute to complete.

Jamf App Installers Troubleshooting

Continuous notifications to update even after quitting the App

If you are still seeing update notifications even after quitting the app and re opening, try

restarting the computer or look for areas where the application is still open, like in the task bar next to the clock.

SECTION: security/corporate/services/laptops/software/_index.md

Overview

Security Policy

Do not install software with many known security vulnerabilities.

Follow the Third Party Risk Management Procedure for review of services individually deployed on endpoint devices. After a decision regarding deployment of an endpoint management solution is made the process will be redesigned accordingly and services, where applicable, will be retroactively reviewed. Please ensure you continue to follow the requirements defined in the acceptable use policy.

SECTION: security/corporate/services/laptops/wipe/_index.md

Overview

Laptop wipes must be performed via scheduling an appointment with an IT analyst to wipe the machine and re-install the base operating system, and remove any and all software and configurations that were supplied by GitLab.

Laptops must be wiped with Jamf for macOS, and Fleet for Linux. Using these tools ensures a clean disk wipe is performed and GitLab can retain evidence of the disk wipe.

Under no circumstance should you perform your own disk wipe unless you are doing so at the request of IT to troubleshoot a technical problem with the laptop. If GitLab discovers that a device has not been wiped according to policy, GitLab may act to enforce a remote wipe without notice.

Schedule a Wipe

Region	IT Analysts	Calendar Link
-----	-----	-----
--		
APAC	Bryan Mathews	Schedule a wipe
APAC	Max Hirata	Schedule a wipe
EMEA	Bruno Ferreira	Schedule a wipe
EMEA	Eoghan Dunne	Schedule a wipe

EMEA	Laurie McClafferty	Schedule a wipe	
AMER	Alex Krusiec	Schedule a wipe	
AMER	Jeff Ford	Schedule a wipe	
AMER	Jenny Wong	Schedule a wipe	
AMER	Madison Spry	Schedule a wipe	
AMER	Mic Rohr	Schedule a wipe

Overview

At GitLab, we use the term onboarding to refer to the first few weeks after a team member was hired and enabling you to be productive. The onboarding processes are cross-functionally managed with Corporate Security, People Operations, and Security Assurance.

We also enable our customers, partners, and vendors that are external to GitLab to collaborate with internal teams on GitLab.com, Google, Slack, etc. Please see the external collaborators handbook page for access requests related to users without a @gitlab.com email address.

Contractors

At GitLab, we use the term team member instead of employee, except in documentation (like this

page) when trying to relate to what you already may be familiar with. See the People Group Employment Solutions page to learn more about the different types of team members, including contractors.

The fundamental difference between a team member contractor and temporary service provider contractor is:

- Team Member Contractors: You were hired by a GitLab recruiter and signed an employment agreement, even if you are employed by a Professional Employer Organization (PEO) based on the country that you live in.
- Temporary Service Provider Contractors: You are employed by a managed service provider or an agency to work on a specific program or project at GitLab for a specified period of time (usually up to 1 year).

Corporate Security also supports the onboarding of both types of contractors, however we have separate processes for temporary service provider contractors.

SECTION: security/corporate/services/phones/_index.md

Overview

Many services that team members use such as Slack and Zoom have mobile applications that can be loaded onto iOS or Android devices, allowing for use of those resources from a mobile phone. Refer to the acceptable use policy for more information on using a mobile device.

Most major applications (Slack, Zoom, Okta Verify) have been examined and vetted by the Security Team, but there are some applications which are not only of limited scope in the data they can access, but also have security issues. In such cases, use the mobile device's web browser for access to the resource. If you have a question about the security of a mobile app and want to know if you should be using it to access GitLab data, review the security tips on this page or contact the Security Team via Slack in the security channel.

Tier 2. Helpdesk Support

We have 24x5 coverage provided by Helpdesk Support Analysts that can help you with access requests, account lockouts, authentication issues, laptop hardware, laptop software configuration problems, 1:1 training for unfamiliar technologies, and triage problems for any Corporate Security Systems.

- Identity and Access Management
 - Access Requests
 - Career Mobility (Mover) and Role Changes Provisioning
 - External Collaborators (Customers, Partners, Vendors)
 - Onboarding (Joiner) Provisioning (Baseline Entitlements) and User Support
 - Offboarding (Leaver) Deprovisioning
 - Service Accounts
 - Temporary Service Providers
- Infrastructure Management
 - AWS
 - GCP
- Laptops and Logistics
- Tech Support for Team Members
 - Account Password and 2FA Resets

Please ask for assistance in the ithelp Slack channel.

Our team members have scheduled on-call shifts, so we kindly ask that you ask in the channel and not send Slack direct messages to specific individuals.

For systems not managed by Corporate Security, you can locate the owner in the tech stack. If you're not sure where to ask, please ask in ithelp and we will redirect you to the right person or place.

Tier 3. Escalation and Systems Engineering

Our Support Analysts are trained to provide user support. If there is a problem that the Support Analysts cannot answer, they will escalate it to the Corporate Security Engineers.

Our Security Engineers and Systems Engineers are the technical owners for our Corporate Security Systems and handle configuration management and engineering work for optimizing and supporting our business requirements and mitigating any security risks.

For team member support requests, please ask for assistance in the ithelp Slack channel.

For advanced requests or change/configuration management, please open a GitLab issue in the Corporate Security Issue Tracker and choose the appropriate issue template that will automatically add the appropriate labels and assign it to the respective system owners.

Courtesy Reminder: We do not provide same day support in our engineering issues. We have a

prioritized queue for our issues that is managed by our engineering managers and program managers. We have allocated buffer in each team to triage new day-to-day requests within a few business days. Please add the appropriate priority label to any issues that you create. Please ask in the ithelp Slack channel for anything urgent and we will handle escalations and prioritization internally.

Tier 4. Automation Engineering

As any company or team evolves and scales, it is important to automate and streamline processes. Most tech companies improve automation and processes using some form of scripting.

At GitLab, each of our departments solves their automation problems independently (organic evolution of our values and solving your own niche problems).

As time allows, our Security Engineers and Systems Engineers work on automation projects to streamline our processes and systems configuration, usually aligned with our security strategy, compliance observations, and/or mitigating identified security risks.

See our automation handbook page to learn more.

Tier 5. Architecture and Crisis Management

Our Staff Engineers and Managers are focused on driving the meta-level direction and improved automation and efficiency of the Corporate Security team and our cross-functional stakeholders that provide a strong security posture in alignment with the security vision while providing great internal customer experience. We also provide swarm-style guidance and engineering for cross-functional or leadership-level crisis and incident mitigation.

SECTION: security/corporate/support/onboarding/_index.md

· Welcome to GitLab! We're glad you're here. The links on this page will help you get your laptop set up and access to the various systems that you will use to collaborate with other team members and start working on projects with your team.

Need Help?

While it may seem a little bit overwhelming at the start, the Corporate Security Helpdesk team is here to make the process as easy as possible!

We host an optional weekly onboarding call every Tuesday (check your calendar) to help new team members with MacBook setup.

Please visit the Corporate Security Support handbook page if you need help. For most questions, simply ask in the ithelp Slack channel.

> Using Linux? If you're one of the very few team members using Linux, see the Linux handbook page to get started.

Productivity Guides

It is understandable if you're overwhelmed during onboarding. To get started in your first few weeks, simply access the following Okta application tiles to get started.

The links for each application below will take you to the step-by-step instructions. If you have any questions or problems accessing these applications, please reach out to ithelp in Slack for 24x5 support. You can also ask your manager, onboarding buddy, or anyone on your team for help.

Collaboration Apps

- G Suite SSO Mail: This is your work email account that uses a Gmail interface that you are likely already familiar with. We do not use Microsoft Outlook or Office 365 at GitLab. Please keep in mind that we rarely/never send emails internally and use Slack or GitLab issues to communicate with other team members.
- GitLab.com: This will automatically provision your GitLab.com user account if you do not already have one. We use our own product to run the company day-to-day and you will spend a lot of time working with issues and merge requests. Your onboarding issue is the first issue assigned to you and will give you a feel for what to expect and how to use the GitLab product.
- GitLab Internal Handbook: We have an internal handbook that requires authentication for information that is not suitable for our public handbook. During your onboarding, you'll need to read through the confidentiality levels and data classification standard.
- Slack SSO: This is where async collaboration happens at GitLab. If you're not familiar with Slack, it is group text messaging on steroids with all of our team members, vendors, and customers, and is similar to Microsoft Teams.
- G Suite SSO Drive This is where our meeting notes are stored at (aka agenda docs), spreadsheets, and slide decks. All of these documents are saved in Google Drive that is managed

by Corporate Security so data is saved securely in the cloud and not locally on team member laptops. We do not use Microsoft Word, Excel, PowerPoint, or SharePoint at GitLab.

- Google Calendar We use Google Calendar for all meeting invitations and integration with various services including Paid Time Off events.

- Zoom SSO: You will be invited to several Zoom calls in your first week. Be sure that your microphone, headphones, and camera are configured.

Employment Apps

As you complete your employment onboarding tasks, you may also need to access these applications.

- Workday SSO: This is our Human Resources Information Systems (HRIS) where all of your employment and benefits information is managed.

- Level Up SSO: This is our learning management system (LMS) that has professional development and product training courses to learn more about various topics.

- Will Learning: Compliance training learning management system (LMS) for some courses

- Navan SSO: This is our expense reporting and travel booking system for most countries.

- Payroll Provider

Accessing Documents and Files

Each team has one or more Google Drive folders or shared drives that will be shared with you. Please ask your onboarding buddy or manager for a tour of where they create and access documents at.

Additional Documentation

We have documentation for many of our systems on the Corporate Security Systems handbook page.

Getting Help

- Corporate Security Systems
- Corporate Security Support
- Ask in the ithelp Slack channel

SECTION: security/corporate/support/usb-encryption/_index.md

How to encrypt your USB mass storage device in either macOS or Linux.

MacOS Instructions

Prerequisites

- A USB drive you wish to encrypt
- macOS 10.13 (High Sierra) or later
- Administrator privileges on your Mac

Steps to Encrypt a USB Drive Using Disk Utility

1. Insert your USB drive into an available USB port on your Mac.

2. Open Disk Utility:

- Navigate to Applications > Utilities > Disk Utility, or...
- Search for "Disk Utility" using Spotlight (press Cmd + Space and type "Disk Utility")

3. Select the USB drive from the sidebar on the left. Be sure to select the drive itself (the top-level entry), not the volume underneath it.

4. Erase and format the drive:

- Click on the "Erase" button in the top toolbar
- Enter a name for your drive
- For "Format", select "APFS (Encrypted)" or "Mac OS Extended (Journaled, Encrypted)"
- For "Scheme", select "GUID Partition Map"
- Click "Erase"

5. Create a password:

- You'll be prompted to create a password for the encrypted drive
- Enter a strong password and verify it
- Optionally, enter a password hint (recommended)
- Click "Choose"

> IMPORTANT: Store this password securely. If you forget it, you cannot recover the data on the drive.

6. Wait for the process to complete, then click "Done".

Your USB drive is now encrypted. Whenever you connect it to a Mac, you'll be prompted to enter the password to access its contents.

Alternative: Using FileVault from Terminal

If you prefer using Terminal, you can also encrypt your USB drive using FileVault:

bash

First identify your disk identifier

diskutil list

Then encrypt the drive (replace "disk2" with your actual disk identifier)

diskutil cs convert disk2 -passphrase

Follow the prompts to create a password

Official macOS Documentation

Apple Support: Encrypt and protect a storage device with a password

Apple Support: Protect data on your Mac with FileVault

Apple Support: Disk Utility Overview

Linux Instructions

Prerequisites

- Existing data on the USB is backed up, as encrypting will erase everything on the USB
- A USB drive you wish to encrypt
- A Linux distribution with LUKS (Linux Unified Key Setup) support (most modern distributions)
- cryptsetup package installed
- Root or sudo privileges

Installing Required Packages

On Debian/Ubuntu-based distributions:

bash

sudo apt update

sudo apt install cryptsetup

On Fedora/RHEL-based distributions:

bash

sudo dnf install cryptsetup

On Arch-based distributions:

```
bash
sudo pacman -S cryptsetup
```

Steps to Encrypt a USB Drive Using LUKS

1. Insert your USB drive into an available USB port on your Linux machine.
2. Identify the device path of your USB drive:

```
bash
lsblk
```

> Look for your USB drive in the output (e.g., /dev/sdb). Make sure you identify the correct device as the following steps will erase all data on it.

3. Create a new partition table (optional but recommended):

```
bash
sudo fdisk /dev/sdX  Replace sdX with your drive identifier
```

- Type o to create a new empty DOS partition table
- Type n to add a new partition
- Follow the prompts to create a primary partition using the entire disk
- Type w to write the changes and exit

4. Initialize LUKS encryption on the partition:

```
bash
sudo cryptsetup luksFormat /dev/sdX1  Replace sdX1 with your partition
```

- You will be asked to confirm the operation by typing "YES" in uppercase
- Then enter and verify a strong passphrase

5. Open the encrypted partition.

```
bash
sudo cryptsetup luksOpen /dev/sdX1 encryptedusb  Replace sdX1 with your partition
```

- Enter the passphrase you set in the previous step.

6. Create a filesystem on the encrypted partition:

```
bash
sudo mkfs.ext4 /dev/mapper/encryptedusb
```

- You can also use other filesystems like mkfs.btrfs or mkfs.xfs if preferred.

7. Mount the encrypted filesystem:

```
bash
sudo mkdir -p /media/encryptedusb
sudo mount /dev/mapper/encryptedusb /media/encryptedusb
```

Safely Unmounting the Encrypted Drive

To safely disconnect your encrypted USB drive:

1. Unmount the filesystem:

```
bash
sudo umount /media/encryptedusb
```

2. Close the encrypted partition:

```
bash
sudo cryptsetup luksClose encryptedusb
```

3. You can now safely remove the USB drive.

Using the Encrypted Drive in the Future

To use your encrypted USB drive again:

1. Insert the USB drive.

2. Open the encrypted partition:

```
bash
sudo cryptsetup luksOpen /dev/sdX1 encryptedusb Replace sdX1 with your partition
```

3. Mount the filesystem:

```
bash
```

```
sudo mount /dev/mapper/encryptedusb /media/encryptedusb
```

4. For easier mounting/unmounting

```
bash
```

```
Add to ~/.bashrc, replacing sdX1 with your partition
```

```
alias mount-encrypted='sudo cryptsetup luksOpen /dev/sdX1 encryptedusb && sudo mount /dev/mapper/encryptedusb /media/encryptedusb'
```

```
alias unmount-encrypted='sudo umount /media/encryptedusb && sudo cryptsetup luksClose encryptedusb'
```

Best Practices for Encrypted USB Storage

1. Choose a strong passphrase that is:

- At least 12 characters long
- A mix of uppercase, lowercase, numbers, and special characters
- Not based on easily guessable personal information

2. Keep a backup of important data stored on the encrypted drive.

3. Store your passphrase securely using a password manager.

4. Always unmount properly before physically removing the drive.

5. Consider multi-factor authentication for highly sensitive data.

6. Perform regular backups of important data stored on encrypted drives.
