

## ux Nonresponsive

If you encounter this situation, you need to force-close and restart the application by entering the following command:

```
shell
sudo systemctl kill -s SIGKILL nordlayer.service
sudo systemctl start nordlayer.service
```

## VPN Authentication on Mac

If the VPN authentication window is constantly popping up on your screen, go to System Preferences -> Network and select the NordLayer connection. Make sure that Connect on Demand is disabled, then click Cancel and it should not reappear.

If you are still seeing the pop-up, restart your Mac and drag the NordLayer app to the trash. Once that is done, re-install NordLayer application directly from the AppStore.

## Onboarding Guide

Congratulations on receiving your YubiKey(s) that you will use for two factor authentication (2FA). If you're familiar with using Touch ID, a YubiKey works almost the same way, however you do not need to register your fingerprint.

See How It Works to learn more.

> Please repeat the steps below for each of the keys. You can perform the steps in parallel with both keys plugged in when configuring 2FA in each application.

1. Insert your YubiKey(s) into an available USB port on your laptop, monitor, or docking station.
2. Open a text editor a empty browser window and tap on the YubiKey's gold contact. You should

see a string get populated. cccccbchbneclfhieffkkgdgiuvukginvnhlefdcbuuc. Your YubiKey is working!

3. Follow the instructions in the guides for each of our applications to configure your YubiKey as a 2FA authenticator. If you have multiple accounts, repeat the steps for each account.

- Okta Guide
- Google Guide
- GitLab Guide

4. You're all set!

## Day-to-Day Usage

### Using YubiKey for 2FA

When prompted to sign into a configuration application in the future, you may see a QR code or ask to use your passkey or Touch ID. Even if it says Passkey or Touch ID, touching your YubiKey still works. You simply need to touch your key, or click on the USB thumb drive icon in the prompt and then touch your key.

<br />

### Adding New Applications

When prompted to enable 2FA in the future, simply tap your key when prompted with a QR code, to enable Touch ID, or to add a Passkey.

If the YubiKey is not working for that application, try using Touch ID, and then fall back to using 1Password to scan the QR code to save the one time password (OTP) to the appropriate record in your 1Password vault.

<br />

<br />

<br />

### Using YubiKey on Mobile Devices

If you have configured an NFC key, see the Android and iOS guides for instructions on signing in with your YubiKey to approved mobile applications that do not use FaceID or biometrics.

### Leaving YubiKey Inserted or Removing

A frequently asked question is whether you should leave your YubiKey plugged in all the time?

This is a personal preference and you can use your own judgement.

### Leave a Nano Key Plugged In

If it's your first time using a YubiKey and you're used to Touch ID, we suggest using the Nano key and leaving it plugged in. If you're working from home, you can leave it plugged in. If you travel to a coffee shop (low risk area), it's still fine.

If you are going to do a long trip, vacation, or anytime you head to the airport, you should unplug your YubiKey and keep it in a separate place from your laptop.

A Nano key is small and easy to lose. If you have a nano key, we recommend leaving it plugged in or stored in a safe place. Do not put it in your pocket or laptop bag without having a specific place to keep it. A life hack is that if you have wireless headphones with a USB-C port, you can plug it into the bottom of those for travel storage.

### Separation with NFC Keys

Many engineering and security conscious people prefer to have it separated (ex. use an NFC key that is on a keyring), while others will leave it plugged in all the time (ex. in their monitor or docking station).

An NFC key is easy to break off when moving a laptop around, so please be sure to unplug the key before picking up your laptop and moving to a different seat.

You can unplug it and plug it back in at any time without "disconnecting/ejecting it" (like a thumb drive).

### How It Works

Each YubiKey is a piece of black plastic with an internal circuit board that exposes gold contacts (slivers of exposed metal). It has a USB-A or USB-C plug that you insert into your laptop or the side of your monitor or docking station.

You can insert it into any port. It is recommended to choose one that you do not use regularly for a power cord, monitor cord, or docking station cable.

<br />

<br />

<br />

### WebAuthn Authentication

When you are prompted for your passkey/2FA/Touch ID, you simply rest your finger on the gold contacts for a split second (similar to touching the fingerprint reader of TouchID sensor), and

the YubiKey activates itself and sends a cryptographic string (as if you typed it) that is recognized by the 2FA technology (FIDO2/WebAuthn) on your computer and the server side. Each press generates a unique string, so the string you see below is useless after a few seconds.

cccccbchbneclfhiefkkgdfkiuvukginvnhlefdcbuuc

Simpler explanation? The oversimplified analogy is that it's similar in concept to SSH key public and private key pairs that are used when you authenticate via SSH (or Git).

<br />

<br />

### Other Authentication Methods

A YubiKey supports a wide range of authentication methods including FIDO2/WebAuthn (hardware bound passkey), FIDO U2F, Yubico OTP, OATH-TOTP, OATH-HOTP, Smart card (PIV) and OpenPGP.

At GitLab, we only use FIDO2/WebAuthn. This works natively on your laptop without installing any of the YubiKey software. Simply insert your key into a USB port and touch the gold contacts when prompted to set up 2FA or a Passkey on any website.

From an IT perspective, we simply want users to insert their YubiKey (out of the box) and touch their key (to use FIDO2/WebAuthn) instead of using Touch ID when authenticating with web applications. All additional usage is at each engineer's discretion, unless it is included in your team's (ex. Site Reliability Engineer) onboarding instructions.

For advanced power users at your discretion (not mandated or supported by IT), you are welcome to install YubiKey Manager, optionally set a pin code on your YubiKey, use your YubiKey for SSH or GPG key storage, or configure slot 1 (short touch) and slot 2 (long touch).

### Primary and Secondary Keys

A YubiKey is similar to a car key. If you lose your car key, you can't start your car. With a secondary/backup car key, you can still get to your appointment on time.

If you lose your YubiKey, it's like losing the car key that allows you to sign in to the web application. With a second YubiKey, both keys are enrolled as 2FA authenticators and although you may only use the secondary/backup one occasionally, it provides assurance that you can still sign in. As a remote company, it's not possible to walk down the hall to the IT Helpdesk to get a new one and it's not logistically feasible to ship you a YubiKey overnight.

Unlike a software authenticator that can be reset by IT and re-enrolled, we can't get you into systems that use YubiKey authentication unless we add you to a bypass 2FA policy that lowers our security posture. We will do this when needed, and during our early deployment of YubiKeys until we can get everyone a secondary/backup key.

Order Process

New Team Members

> Upcoming Iteration in FY25-Q2

IT will automatically ship a primary YubiKey to new hire team members in the Engineering,

Product, and Security divisions when they fill out their laptop order form. No action or approvals are required.

### Existing Team Members

In FY25-Q1, IT performed a mass distribution of the latest generation of YubiKey 5 FIPS keys to all team members in the Engineering, Product, and Security divisions. These divisions will be required to use a YubiKey for 2FA after IT completes our system configuration change management in FY25-Q2.

Any team member (any division) can request a YubiKey as an alternative to using Touch ID, no questions asked. Our policies are designed for mass distribution efficiency and do not prevent any user in other divisions from using a YubiKey.

### Self Service Order

You can self service order a primary YubiKey using the following process. We will be iterating on ordering backup keys in the near future.

If you would like a replacement YubiKey or a new YubiKey for the first time, verify that your country is the list of supported countries. If your country is in the list of Unsupported Countries or you have questions, please ask in [ithelp](#) for guidance.

1. Open Slack.
2. Type /yubikey in any message or channel.
3. A self-service order form will open that you can fill out.
  - > This is connected to our centralized ordering portal. Your order is paid for centrally by GitLab and you do not need to submit an expense report.
4. Please allow a few days for vendor processing. An email confirmation is sent to you when your YubiKeys have shipped.
5. Depending on your country, you will usually receive your YubiKey within 2 weeks.

### YubiKey Procurement Policy

#### Who Uses a YubiKey

##### Engineer Users

> Effective FY25-Q2

All team members in the Engineering, Product, and Security divisions are required to use YubiKeys for accessing administrative systems, sensitive Okta applications, or AWS/GCP infrastructure. You can use Touch ID for non-sensitive Okta applications or any Mac applications that allow you to use Touch ID.

##### Business Users

Team members in the CEO, Finance, Legal, Marketing, People, or Sales divisions are required to use MacBook Touch ID (instead of a YubiKey) since the majority of applications used by these divisions are accessed through Okta where we have stronger device assurance policies. Any team

member in these division can opt-in to use a YubiKey (no questions asked).

We originally wanted to deploy YubiKeys to the entire company, however we have a physical constraint since a YubiKey will occupy a USB-C port and most team members in these divisions have a 13" MacBook that only has 2 ports that are usually occupied for monitor and power cords.

We shifted our focus to team members with 14"/16" MacBook Pros with 3 ports + magsafe power. The Engineering, Product, and Security divisions access a wide range of applications, infrastructure, and backend systems that are not in Okta, so that is where we are focusing our efforts.

<br />

#### Linux Users

Any team members with Linux laptops are required to use a YubiKey for all 2FA.

#### Contractors and Temporary Service Providers

Any temporary service provider that does not have a GitLab-issued MacBook and cannot install 1Password (license provided by GitLab) can be shipped a YubiKey for authentication to Okta and any granted services. This is a common need for third party service providers that use Windows devices.

Please ask in ithelp for assistance.

#### YubiKey Models

<br />

#### YubiKey 5C Nano FIPS

A YubiKey 5C Nano FIPS ("Nano") key has a small form factor that is designed to be permanently plugged into a USB-C port and doesn't have a risk of falling out or breaking off.

- Recommended as primary key (set it and forget it)
- Can be inserted in the laptop and left there for easy touch at any time (they practically disappear).
- It does not have the risk of breaking off or getting in your way as you move around with your laptop.
- Not recommended if you need to remove the key frequently since it's hard to grip and easy to lose.

<br />

#### YubiKey 5C NFC FIPS

A YubiKey 5C NFC FIPS ("NFC") key acts just like a nano key with additional benefits when using mobile phones or a larger form factor for carrying a key with you.

A near field communication ("NFC") key looks like a USB thumb drive and has the ability to wirelessly act as an authenticator on mobile devices by holding the key up to the phone (for iPhone it is near the top by the camera) without needing to have a key plugged in.

This simply provides versatility. Since the authenticator is registered on the server side, you can use it by plugging it into your laptop, into the USB-C port of your iPad or tablet, or using NFC wireless technology on an iPhone with a lightning port (that doesn't have USB-C).

We expect to continue using FaceID and will not enforce YubiKey on phones since we have a limited number of allowed mobile applications that do not include any applications with sensitive access or data. In other words, using a YubiKey for phone application 2FA is optional and is a personal preference.

- Recommended as backup key due to its versatility.
- Can be put on a keychain and inserted or removed as needed.
- Can be left in your monitor port or docking station if your laptop is not reachable at your desk. You may need a USB-A key if you have an older monitor without USB-C ports. A small docking station or adapter may be better in some cases.
- NFC supports wireless authentication with recent iPhone and many Android devices (if it supports tap payments, it should support YubiKey NFC).

<br />

### Other YubiKey Models

The YubiKey 5C FIPS key works, however the NFC keys are recommended for the additional functionality and are what we stock our inventory with.

We no longer recommend YubiKey 5Ci FIPS key that includes an Apple Lightning port since the recent generations of iPhones support NFC wireless keys. They are also awkward on keychains.

Any non-FIPS YubiKey models are no longer supported and will not be allowed with our next-generation authentication policies that have string recognition matching for YubiKey 5 FIPS for FIPS-compliant models.

### Form Factors

Since our MacBooks use USB-C, we default to USB-C models.

The only use case for USB-A is if you have USB-A ports on the side or bottom of your monitor or in your docking station that you can touch easier than reaching for your laptop when docked at your desk. These can be ordered through the self service order process.

### FIPS vs Non-FIPS

You will not notice any difference as a user.

A FIPS key will have FIPS printed on the key next to the serial number. You may need to turn the key over to see it if it's in your USB port.

To avoid a commingled mix of keys and protocols in our fleet, we have standardized on the YubiKey 5 FIPS models for future proofing as part of our Results for Customers value.

Low Context: A YubiKey 5 itself is secure as an MFA authenticator. The FIPS protocol provides advanced cryptographic security that meets audit and compliance requirements in some regulated sectors that GitLab works with and is a service provider for.

Replacing Old Keys: We are replacing keys for any team members that have a non-FIPS YubiKey.

Technical Research: The Federal Information Processing Standard ("FIPS") 140-2 specifies the security requirements that will be satisfied by a cryptographic module, providing four increasing, qualitative levels intended to cover a wide range of potential applications and environments. This validation enables government agencies and regulated industries to meet the highest authenticator assurance level 3 (AAL3) requirements from the new NIST SP800-63B guidance.

You can learn more on the Yubico website.

## Countries

### Supported Countries

The following countries have standard shipping rates and will arrive in 1-2 weeks.

- Austria (AT)
- Belgium (BE)
- Bulgaria (BG)
- Cambodia (KH)
- Canada (CA)
- Chile (CL)
- Czechia (CZ)
- Germany (DE)
- Denmark (DK)
- Finland (FI)
- France (FR)
- Hungary (HU)
- Ireland (IE)
- Israel (IL)
- Italy (IT)
- Lithuania (LT)
- Luxembourg (LU)
- Latvia (LV)
- Malta (MT)
- Netherlands (NL)
- Norway (NO)
- Poland (PL)
- Portugal (PT)

- Romania (RO)
- Spain (ES)
- Sweden (SE)
- Slovenia (SI)
- Switzerland (CH)
- United Kingdom (GB)
- United States (US)

The following countries have higher shipping costs due to regional logistics factors. We still support shipping to these countries, however will try to ensure that we ship a primary and secondary/backup key to avoid the cost of future shipment costs if a key is broken or lost.

- Australia (AU)
- Indonesia (ID)
- Japan (JP)
- Mexico (MX)
- New Zealand (NZ)
- Philippines (PH)
- Singapore (SG)
- Taiwan (TW)

#### Unsupported Countries

Due to shipping provider support, we do not have standard processes to ship to the following countries. This list of countries represents a very small percentage of team members.

For some countries, we may ask team members if they use a proxy package/parcel service in another one of our supported countries. If that's not possible, IT will collaborate with you to evaluate company or self-procurement options on a case-by-case basis.

- Armenia (AM)
- Angola (AO)
- Bosnia (BA)
- Brazil (BR)
- Columbia (CO)
- Costa Rica (CR)
- Ecuador (EC)
- Egypt (EG)
- India (IN)
- Kenya (KE)
- Morocco (MA)
- Moldova (MD)
- Malaysia (MY)
- Panama (PA)
- Pakistan (PK)
- Paraguay (PY)
- Serbia (RS)
- South Africa (ZA)
- South Korea (KR)
- Turkey (TR)

- Ukraine (UA)
- Vietnam (VN)

## SECTION: security/customer-support-operations/\_index.md

## Purpose

The purpose of Customer Support Operations is to enable GitLab to provide delightful customer experiences by:

- equipping the Customer Support team with knowledge, tools and data to optimize productivity and efficiently solve customer problems.
- equipping our customers and wider GitLab with the data, knowledge and insights to prevent customer problems before they occur.
- delivering delightful experiences to both our own internal and external customers.

Our purpose statement is re-evaluated as needed, at minimum every 3 years

## Meet the team

| Name            | Role                                            |
|-----------------|-------------------------------------------------|
| -----           | -----                                           |
| Steve Manzuik   | Senior Director, Security                       |
| Lyle Kozloff    | Sr. Manager, Customer Support Operations        |
| Jason Colyer    | Fullstack Engineer, Customer Support Operations |
| Nabeel Bilgrami | Customer Support Operations Specialist          |

## Working with us

- Use this template if you want something new or modified
- Use this template to file a bug report

Or you can reach out to us in Slack via supportoperations.

## Basic issue flow

## Bug Reports

The issue will be created in the Triage stage. From here, Customer Support Operations will

validate the bug (if it is invalid, the request will be closed).

If it is valid, it will then move to the Planning stage (with all appropriate labels put in place), where a gameplan will be made.

Once a gameplan is made, it will jump to the Development stage, where the changes will be made.

Once it is ready for review, we will ask the requester (or someone they delegate this to) will validate the changes fix the bug.

Once validated, it will then move to the Implementation stage, where it will be implemented into production.

Once that is done, the issue will move to the Completed stage (and be closed out).

### Feature requests

The issue will be created in the Triage stage. From here, Customer Support Operations will determine if the request has enough information to move onto next stages (if not, we will ask for more information).

Customer Support Operations will then determine if all needed approvals are present. The general logic used is:

- If the request aligns with something on the support roadmap and seems congruent with the intention, then no approval required
- If the request aligns with something on the support roadmap but is not congruent with the intention, then we will ask for one of the following:
  - The support roadmap be updated
  - Support leadership approval be documented on the request
- If the request does not align with something on the support roadmap, then we will ask for an appropriate level of approval from support leadership based on:
  - the amount of work
  - any danger to planned work
  - effect on customer or support workflows

If approved, it will then move to the Planning stage (with all appropriate labels put in place), where a gameplan will be made.

Once a gameplan is made and added to the issue, it will then move to the Scheduling stage. Here, Customer Support Operations will determine when it can be implemented. After that is decided, an iteration, milestone, and Customer Support Operations DRI will be added to the issue (which indicates the period the work will be done in).

If the iteration is not the current one, then the request will be moved to the Queued stage, where it will wait until the iteration the request is assigned to comes up.

Once the iteration period arrives, the request will move to the Development stage. Here, work will be done to get the changes into a state where they can be tested and validated. Notes will often be added on what kind of changes were made (and where) to help in later stages.

Once all changes are ready to be validated, we will add the label Validation::Requested and make a comment on the issue asking the requester (or someone they delegate this to) to validate the changes done will meet their requirements for the request. What happens next depends on the results of said validation:

- If approved, the label Validation::Received will be added to the issue (and the issue moved to the Implementation stage)
- If not approved, the label Validation::Rejected will be added to the issue (where it will remain in Development to be tweaked for another round of validation).

Once a request is in the Implementation, we will add a comment detailing the technical blueprint of what was done (which should include links to merge requests, followup issues, etc.). We will also begin implementation the changes into production (the exact method depends on what is changing).

Once all that is done, the stage moves to Completed, where the issue is closed out.

## SECTION: security/customer-support-operations/change-criticalities.md

## Overview

Mirroring infrastructure's change management criticalities, Customer Support Operations defines changes on a C1 - C4 scale that helps determine appropriate planning horizons.

Criticalities are taken into effect when deciding on which deployment an issue/MR will make it into.

## Determining Criticality

When you first begin working an issue or MR, you should determine the change criticality of the task at hand.

For guidance on determining the change criticality, see below.

Always use your best judgment on determining the criticality level. When in doubt, reach out to a Customer Support Operations Manager for assistance.

## Criticality level definitions

### Criticality 1

These are changes with high impact or high risk that may significantly modify Support Engineer or Customer experience. If a change is going to cause downtime to the environment, it is always categorized a C1.

Some examples of Criticality 1 requests are:

- Changing the functionality of a widely used Zendesk View

- Altering Zendesk in a way to support a significant process change
- Changes to any SLA policy in use

## Criticality 2

These are changes that aren't expected to significantly impact Support Engineer or Customer experiences, but which still carry some risk of impact if something unexpected happens.

Some examples of Criticality 2 requests are:

- Updating the theme on the Sup
